

AWR1843AOP SWRS236C - MARCH 2021 - REVISED JANUARY 2024

AWR1843AOP Single-chip 77- and 79-GHz FMCW mmWave Sensor Antennas-On-Package (AOP)

1 Features

- FMCW transceiver
 - Integrated 4 receivers and 3 transmitters Antennas-On-Package (AOP)
 - Integrated PLL, transmitter, receiver, Baseband, and ADC
 - 76- to 81-GHz coverage with 4 GHz available bandwidth
 - Ultra-accurate chirp engine based on fractional-
 - TX Effective isotropic radiated power (EIRP):
 - RX Effective isotropic noise figure: 10 dB (76 to 81 GHz)
 - Phase noise at 1 MHz:
 - -95 dBc/Hz (76 to 77 GHz)
 - –93 dBc/Hz (77 to 81 GHz)
- Built-in calibration and self-test (monitoring)
 - Arm® Cortex®-R4F-based radio control system
 - Built-in firmware (ROM)
 - Self-calibrating system across process and temperature
- C674x DSP for FMCW signal processing
- On-chip Memory: 2MB RAM
- Arm Cortex-R4F microcontroller for object tracking and classification, AUTOSAR, and interface control
 - Supports autonomous mode (loading user application from QSPI flash memory)
- Host interface
 - CAN (two instances, one being CAN-FD)
- Other interfaces available to user application
 - Up to 6 general purpose ADC channels
 - Up to 2 SPI ports
 - Up to 2 UARTs
 - I^2C
 - GPIOs
 - 2-lane LVDS interface for raw ADC data and debug instrumentation

2 Applications

- Car door opener applications
- Blind spot detection
- Lane change assistance
- Cross traffic alert
- Parking assistance

- Device Security (on select part numbers)
 - Secure authenticated and encrypted boot support
 - Customer programmable root keys, symmetric keys (256 bit), Asymmetric keys (up to RSA-2K) with Key revocation capability
 - Crypto software accelerators PKA, AES (up to 256 bit), SHA (up to 256 bit), TRNG/DRGB
- **Functional Safety-Compliant**
 - Developed for functional safety applications
 - Documentation available to aid ISO26262 functional safety system design up to ASIL-D
 - Hardware integrity up to ASIL-B
 - Safety-related certification
 - ISO 26262 certified up to ASIL B by TUV SUD
- AEC-Q100 qualified
- AWR1843AOP advanced features
 - Embedded self-monitoring with no host processor involvement
 - Complex baseband architecture
 - Embedded interference detection capability
 - Programmable phase rotators in transmit path to enable beam forming
- Power management
 - Built-in LDO network for enhanced PSRR
 - I/Os support dual voltage 3.3 V/1.8 V
- Clock source
 - Supports external oscillator at 40 MHz
 - Supports externally driven clock (square/sine)
 - Supports 40 MHz crystal connection with load capacitors
- Easy hardware design
 - 0.8-mm pitch, 180-pin 15 mm × 15 mm flip chip BGA package (ALP) for easy assembly and low-cost PCB design
 - Small solution size
- **Operating Conditions**
 - Junction Temperature range: –40°C to 125°C

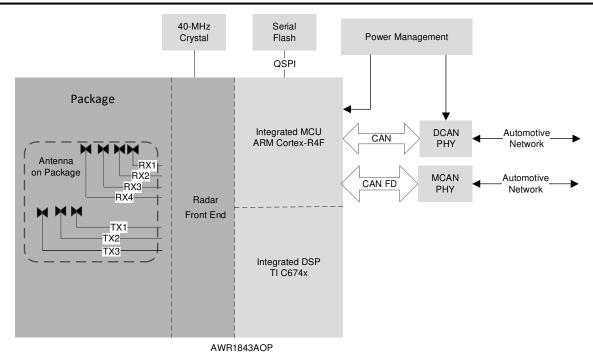

Figure 2-1. Autonomous Radar Sensor for Automotive Applications

3 Description

The AWR1843AOP is an Antenna-On-Package device capable of operation in the 76- to 81GHz band. The device is built with TI's low-power 45-nm RFCMOS process and enables unprecedented levels of integration in an extremely small form factor. The AWR1843AOP is an ideal solution for low-power, self-monitored, ultra-accurate radar systems in the automotive space.

It integrates a DSP subsystem, which contains TI's high-performance C674x DSP for the Radar Signal processing. The device includes a BIST processor subsystem, which is responsible for radio configuration, control, and calibration. Additionally the device includes a user programmable Arm Cortex-R4F based for automotive interfacing. The Hardware Accelerator block (HWA) can perform radar processing and can offload the DSP in order to execute higher level algorithms. Simple programming model changes can enable a wide variety of sensor applications with the possibility of dynamic reconfiguration for implementing a multimode sensor. Additionally, the device is provided as a complete platform solution including reference hardware design, software drivers, sample configurations, API quide, and user documentation.

PART NUMBER	PACKAGE ⁽¹⁾	BODY SIZE	TRAY / TAPE AND REEL
AWR1843ARBGALPQ1	FCBGA (180)	15 mm × 15 mm	Tray

Product status	Product Preview (PP), Advance Information (AI), or Production Data (PD)	PD ⁽⁵⁾				

⁽¹⁾ Developed for Functional Safety applications, the device supports hardware integrity upto ASIL-B. Refer to the related documentation for more details.

⁽²⁾ Device security features including Secure Boot and Customer Programmable Keys are available in select devices for only select part variants as indicated by the Device Type identifier in Section 3, Device Information table.

⁽³⁾ The LVDS interface is not a production interface and is only used for debug.

^{(4) 3} Tx Simultaneous operation is supported only with 1-V LDO bypass and PA LDO disable mode. In this mode, the 1-V supply needs to be fed on the VOUT PA pin.

⁽⁵⁾ PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of the Texas Instruments standard warranty.

4.1 Related Products

For information about other devices in this family of products or related products see the links that follow.

mmWave Sensors

TI's mmWave sensors rapidly and accurately sense range, angle and velocity with less power using the smallest footprint mmWave sensor portfolio for automotive applications.

Automotive mmWave Sensors

TI's automotive mmWave sensor portfolio offers high-performance radar front end to ultra-high resolution, small and low-power single-chip radar solutions. TI's scalable sensor portfolio enables design and development of ADAS system solution for every performance, application and sensor configuration ranging from comfort functions to safety functions in all vehicles.

The following list describes the table column headers:

- 1. **BALL NUMBER:** Ball numbers on the bottom side associated with each signal on the bottom.
- 2. BALL NAME: Mechanical name from package device (name is taken from muxmode 1).
- 3. **SIGNAL NAME:** Names of signals multiplexed on each ball (also notice that the name of the ball is the signal name in muxmode 1).
- 4. PINCNTL ADDRESS: MSS Address for PinMux Control
- 5. MODE: Multiplexing mode number: value written to PinMux Cntl register to select specific Signal name for this Ball number. Mode column has bit range value.
- 6. **TYPE:** Signal type and direction:
 - I = Input
 - O = Output
 - IO = Input or Output
- 7. BALL RESET STATE: The state of the terminal after supplies are stable after power-on-reset (NRESET) is asserted
- 8. PULL UP/DOWN TYPE: indicates the presence of an internal pullup or pulldown resistor. Pullup and pulldown resistors can be enabled or disabled via software.
 - Pull Up: Internal pullup
 - Pull Down: Internal pulldown

- An empty box means No pull.
- 9. Pin Mux Control Value maps to lower 4 bits of register.

IO MUX registers are available in the MSS memory map and the respective mapping to device pins is as follows:

Table 5-2. PAD IO Control Registers

Default Pin/Ball Name	Package Ball /Pin (Address)	Pin Mux Config Register
SPI_HOST_INTR	B2	0xFFFFEA00
GPIO_0	M2	0xFFFFEA04
GPIO_1	L3	0xFFFFEA08
SPIA_MOSI	F2	0xFFFFEA0C
SPIA_MISO	D1	0xFFFFEA10
SPIA_CLK	D2	0xFFFFEA14

The register layout is as follows:

Table 5-3. PAD IO Register Bit Descriptions

BIT	FIELD	ТҮРЕ	RESET (POWER ON DEFAULT)	DESCRIPTION
31-11	NU	RW	0	Reserved
10	SC	RW	0	IO slew rate control: 0 = Higher slew rate 1 = Lower slew rate
9	PUPDSEL	RW	0	Pullup/PullDown Selection 0 = Pull Down 1 = Pull Up (This field is valid only if Pull Inhibit is set as '0')
8	PI	RW	0	Pull Inhibit/Pull Disable 0 = Enable 1 = Disable
7	OE_OVERRIDE	RW	1	Output Override
6	OE_OVERRIDE_CTRL	RW	1	Output Override Control: (A '1' here overrides any o/p manipulation of this IO by any of the peripheral block hardware it is associated with for example a SPI Chip select)
5	IE_OVERRIDE	RW	0	Input Override
4	IE_OVERRIDE_CTRL	RW	0	Input Override Control: (A '1' here overrides any i/p value on this IO with a desired value)
3-0	FUNC_SEL	RW	1	Function select for Pin Multiplexing (Refer to the Pin Mux Sheet)

5.3 Signal Descriptions

Note

All IO pins of the device (except NERROR IN, NERROR_OUT, and WARM_RESET) are non-failsafe; hence, care needs to be taken that they are not driven externally without the VIO supply being present to the device.

Note

The GPIO state during the power supply ramp is not ensured. In case the GPIO is used in the application where the state of the GPIO is critical, even when NRESET is low, a tri-state buffer should be used to isolate the GPIO output from the radar device and a pull resister used to define the required state in the application. The NRESET signal to the radar device could be used to control the output enable (OE) of the tri-state buffer.

5.3.1 Pin Functions - Digital and Analog [ALP Package]

Table 5-4 lists the pins by function and describes that function.

NAME	I/O	DESCRIPTION	NO.				
	DIGITAL						
BSS_UART_TX	0	Debug UART Transmit [Radar Block]	D3, E2, K3, L2, U8, U10, U16, V16				
CAN_FD_RX	I	CAN FD (MCAN) Receive Signal	A4, B3, E2, F2, K2, U8, V16				
CAN_FD_TX	0	CAN FD (MCAN) Transmit Signal	B4, C3, D1, D3, J3, T3, U16				
CAN_RX		CAN (DCAN) Receive Signal	D2				
CAN_TX		CAN (DCAN) Transmit Signal	C2				
DMM0	I	Debug Interface (Hardware In Loop) - Data Line	U7

FRAME START	0	Pulse signal indicating the start of each frame	K3, V10, V13
_	0		
CHIRP_START		Pulse signal indicating the start of each chirp	K3, V10, V13
CHIRP_END	0	Pulse signal indicating the end of each chirp	K3, V10, V13
ADC_VALID	0	When high, indicating valid ADC samples	B2, L3, M2

NAME	1/0	Functions - Digital and Analog [ALP Package] (contin	NO.
WARM_RESET	Ю	Open drain fail safe warm reset signal. Can be driven from PMIC for diagnostic or can be used as status signal that the device is going through reset.	U13
		ANALOG	
NRESET	I	Power on reset for chip. Active low	U11
CLKP	I	In XTAL mode: Differential port for reference crystal In External clock mode: Single ended input reference clock port	A7
CLKM	I	In XTAL mode: Differential port for reference crystal In External clock mode: Connect this port to ground	B7
OSC_CLKOUT	0	Reference clock output from clocking sub system after cleanup PLL (1.4-V output voltage swing).	A14, K3
VBGAP	0	Device's Band Gap Reference Output	A16
VDDIN	Power	1.2V digital power supply	E1, J1, V4, V8, V15
VIN_SRAM	Power	1.2V power rail for internal SRAM	A5, V6, V12
VNWA	Power	1.2V power rail for SRAM array back bias	C1, V7, V14
VIOIN	Power	I/O Supply (3.3V or 1.8V): All CMOS I/Os would operate on this supply	H1, V9
VIOIN_18	Power	1.8V supply for CMOS IO	B1, F1, K1, V11
VIN_18CLK	Power	1.8V supply for clock module	C15, C18
VIOIN_18DIFF	Power	1.8V supply for LVDS port	U2
VPP	Power	Voltage supply for fuse chain	V2
VIN_13RF1	Power	1.3V Analog and RF supply,VIN_13RF1 and VIN_13RF2 could be shorted on the board	J16, J17, J18
VIN_13RF2	Power	1.3V Analog and RF supply	H16, H17, H18
VIN_18BB	Power	1.8V Analog base band power supply	M16, M17, M18
VIN_18VCO	Power	1.8V RF VCO supply	A12, C11
VSS	Ground	Digital ground	A1, A2, E3, F3, N3, P3, R3, T4, T5, T6, T7, T8, T9, T10, T11, T12, T13, T14, T15, T16, U1, V1
VSSA	Ground	Analog ground	A6, A8, A11, A13, A15, A17, A18, B6, B8, B9, B10, B11, B12, B13, B14, B15, B16, B17, B18, C6, C7, C8, C12, C13, C14, C16, C17, D16, D17, D18, E16, E17, E18, F16, F17, F18, K16, K17, K18, L16, L17, L18, N16, N17, N18, P16, R16, R17, T17, U17, U18, V17, V18
VOUT_14APLL	0	Internal LDO output	A10
VOUT_14SYNTH	0	Internal LDO output	A9
VOUT_PA	10	Internal LDO output	G16, G17, G18
Analog Test1 / GPADC1	Ю	Analog IO dedicated for ADC service	P18
Analog Test2 / GPADC2	Ю	Analog IO dedicated for ADC service	P17
Analog Test3 / GPADC3	Ю	Analog IO dedicated for ADC service	R18
Analog Test4 / GPADC4	Ю	Analog IO dedicated for ADC service	T18
ANAMUX / GPADC5	10	Analog IO dedicated for ADC service	C9
		Analog IO dedicated for ADC service	C10

6 Specifications

6.1 Absolute Maximum Ratings

	PARAMETERS ^{(1) (2)}	MIN	MAX	UNIT
VDDIN	1.2 V digital power supply	-0.5	1.4	V
VIN_SRAM	1.2 V power rail for internal SRAM	-0.5	1.4	V
VNWA	1.2 V power rail for SRAM array back bias	-0.5	1.4	V
VIOIN	I/O supply (3.3 V or 1.8 V): All CMOS I/Os would operate on this supply.	-0.5	3.8	V
VIOIN_18	1.8 V supply for CMOS IO	-0.5	2	V
VIN_18CLK	1.8 V supply for clock module	-0.5	2	V
VIOIN_18DIFF	1.8 V supply for LVDS port	-0.5	2	V
VIN_13RF1	1.3 V Analog and RF supply, VIN_13RF1 and VIN_13RF2 could	-0.5	1.45	V
VIN_13RF2	be shorted on the board.	-0.5	1.45	V
VIN_13RF1 VIN_13RF2	1-V Internal LDO bypass mode. Device supports mode where external Power Management block can supply 1 V on VIN_13RF1 and VIN_13RF2 rails. In this configuration, the internal LDO of the device would be kept bypassed.	-0.5	1.4	V
VIN_18BB	1.8-V Analog baseband power supply	-0.5	2	V
VIN_18VCO supply	1.8-V RF VCO supply	-0.5	2	V

6.5 Power Supply Specifications

Table 6-1 describes the four rails from an external power supply block of the AWR1843AOP device.

Table 6-1. Power Supply Rails Characteristics

SUPPLY	DEVICE BLOCKS POWERED FROM THE SUPPLY	RELEVANT IOS IN THE DEVICE
1.8 V	Synthesizer and APLL VCOs, crystal oscillator, IF Amplifier stages, ADC, LVDS	Input: VIN_18VCO, VIN18CLK, VIN_18BB, VIOIN_18DIFF, VIOIN_18IO LDO Output: VOUT_14SYNTH, VOUT_14APLL
1.3 V (or 1 V in internal LDO bypass mode) ⁽¹⁾	Power Amplifier, Low Noise Amplifier, Mixers and LO Distribution	Input: VIN_13RF2, VIN_13RF1 LDO Output: VOUT_PA
3.3 V (or 1.8 V for 1.8 V I/O mode)	Digital I/Os	Input VIOIN
1.2 V	Core Digital and SRAMs	Input: VDDIN, VIN_SRAM

⁽¹⁾ Three simultaneous transmitter operation is supported only in 1-V LDO bypass and PA LDO disable mode. In this mode 1V supply needs to be fed on the VOUT PA pin.

The 1.3-V (1.0 V) and 1.8-V power supply ripple specifications mentioned in Table 6-2 are defined to meet a target spur level of -105 dBc (RF Pin = -15 dBm) at the RX. The spur and ripple levels have a dB-to-dB relationship, for example, a 1-dB increase in supply ripple leads to a \sim 1 dB increase in spur level. Values quoted are rms levels for a sinusoidal input applied at the specified frequency.

Table 6-2. Ripple Specifications

Table 6 In tappie epochications							
	RF RAIL	VCO/IF RAIL					
FREQUENCY (kHz)	1.0 V (INTERNAL LDO BYPASS) (μV _{RMS})	1.3 V (μV _{RMS})	1.8 V (μV _{RMS})

6.6 Power Consumption Summary

Table 6-3 and summarize the power consumption at the power terminals.

Table 6-3. Maximum Current Ratings at Power Terminals

PARAMETER	SUPPLY NAME	DESCRIPTION	MIN	TYP	MAX	UNIT
	VDDIN, VIN_SRAM, VNWA	Total current drawn by all nodes driven by 1.2V rail			1000	
Current consumption	VIN_13RF1, VIN_13RF2	Total current drawn by all nodes driven by 1.3V or 1.0V rail (2TX, 4 RX simultaneously) ⁽¹⁾			2000	mA
	VIOIN_18, VIN_18CLK, VIOIN_18DIFF, VIN_18BB, VIN_18VCO	Total current drawn by all nodes driven by 1.8V rail			850	
	VIOIN	Total current drawn by all nodes driven by 3.3V rail			50	

^{(1) 3} Transmitters can simultaneously be deployed only in AWR1843AOP and AWR2243 devices with 1V / LDO bypass and PA LDO disable mode. In this mode 1V supply needs to be fed on the VOUT PA pin. In this case the peak 1V supply current goes up to 2500 mA.

Table 6-4. Average Power Consumption at Power Terminals

PARAMETER		CONDITION		DESCRIPTION	MIN	TYP	MAX	UNIT	
	1TX, 4RX Use Case: Regular mode, 6.4		, ,						
		2TX, 4RX MSps complex transceiver, 25-			ms frame time, 128 chirps, 128 samples/chirp, 5-µs idle time (25% duty cycle), 3us ADC start time and excess ramp time, DSP and HWA active Use Case: Regular mode, 6.4	1.36			
Average power	1.0-V internal	25% Duty Cycle	3TX, 4RX					w	
consumption	mode	DO bypass 1T	node 1 TX, 4RX Use			1.82		٧٧	
			2TX, 4RX MSps complex transceiver, 25 ms frame time, 256 chirps, 12		MSps complex transceiver, 25- ms frame time, 256 chirps, 128		1.96		
		50% Duty Cycle	3TX, 4RX	samples/chirp, 5-µs idle time (50% duty cycle), 3us ADC start time and excess ramp time, DSP and HWA active		2.08			

6.7 RF Specification

over recommended operating conditions (unless otherwise noted)

	PARAMETER	·	MIN	TYP	MAX	UNIT
	Effective isotropic noise figure ⁽¹⁾			10		dB
	IF bandwidth ⁽²⁾			10	MHz	
Receiver	ADC sampling rate (real)				25	Msps
Receiver	ADC sampling rate (complex 1x)				12.5	Msps
	ADC resolution		12		Bits	
	Idle Channel Spurs		-90		dBFS	
Transmitter	Single transmitter effective isotropic radiated power (EIRP)			16		dBm
Antenna	Receiver antenna 8dB beamwidth			±60		deg
Antenna	Transmitter antenna 6dB beamwidth			±60		deg
	Frequency range		76		81	GHz
Clask subsystem	Ramp rate				100	MHz/µs
Clock subsystem	Phase noise at 1-MHz offset	76 to 77 GHz		-95		dBc/Hz
	Fridate Hoise at 1-WITZ Offset	77 to 81 GHz		-93		UDC/FIZ

(1) Specification is quoted for complex 1x mode.

The analog IF stages include high-pass filtering, with two independently configurable first-order high-pass corner frequencies. The set of available HPF corners is summarized as follows:

Available HPF Corner Frequencies (kHz)

HPF1

175, 235, 350, 700 350, 700, 1400, 2800

The filtering performed by the digital baseband chain is targeted to provide:

- Less than ±0.5 dB pass-band ripple/droop, and
- Better than 60 dB anti-aliasing attenuation for any frequency that can alias back into the pass-band.

Product Folder Links: AWR1843AOP

6.10.2 Antenna Positions

Figure 6-5 shows the placement and relative spacing of the antennas. Lambda corresponds to a frequency of 78.5 GHz.

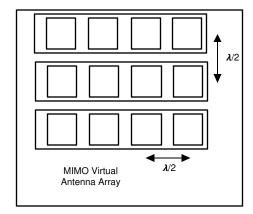

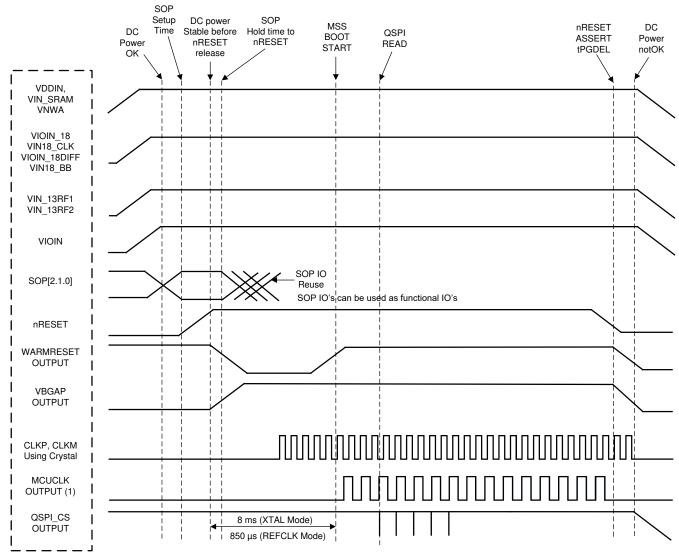

Figure 6-5. Antenna Positions (Placement and Relative Spacing)

6.10.3 Power Supply Sequencing and Reset Timing

The AWR1843AOP device expects all external voltage rails and SOP lines to be stable before reset is deasserted. Figure 6-6 describes the device wake-up sequence.

A. MCU_CLK_OUT in autonomous mode, where AWR1843AOP application is booted from the serial flash, MCU_CLK_OUT is not enabled by default by the device bootloader.

Figure 6-6. Device Wake-up Sequence

6.10.4 Input Clocks and Oscillators

6.10.4.1 Clock Specifications

The AWR1843AOP requires external clock source (that is, a 40-MHz crystal or external clock) for initial boot and as a reference for an internal APLL hosted in the device. An external crystal is connected to the device pins. Figure 6-7 shows the crystal implementation.

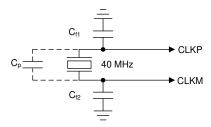

Figure 6-7. Crystal Implementation

Note

The load capacitors, C_{f1} and C_{f2} in Figure 6-7, should be chosen such that Equation 1 is satisfied. C_L in the equation is the load specified by the crystal manufacturer. All discrete components used to implement the oscillator circuit should be placed as close as possible to the associated oscillator CLKP and CLKM pins.

$$C_{L} = C_{f1} \times \frac{C_{f2}}{C_{f1} + C_{f2}} + C_{P}$$
 (1)

Table 6-5 lists the electrical characteristics of the clock crystal.

Table 6-5. Crystal Electrical Characteristics (Oscillator Mode)

NAME	DESCRIPTION	MIN	TYP	MAX	UNIT
f _P	Parallel resonance crystal frequency		40		MHz
C _L	Crystal load capacitance	5	8	12	pF
ESR	Crystal ESR			50	Ω
Temperature range	Expected temperature range of operation	-40		140	°C
Frequency tolerance	Crystal frequency tolerance ⁽¹⁾ (2)	-200		200	ppm
Drive level			50	200	μW

⁽¹⁾ The crystal manufacturer's specification must satisfy this requirement.

⁽²⁾ Includes initial tolerance of the crystal, drift over temperature, aging and frequency pulling due to incorrect load capacitance.

Table 6-6. External Clock Mode Specifications

DADAM	PARAMETER		PECIFICATION	N	UNIT

6.10.5 Multibuffered / Standard Serial Peripheral Interface (MibSPI)

6.10.5.1 Peripheral Description

The MibSPI/SPI is a high-speed synchronous serial input/output port that allows a serial bit stream of programmed length (2 to 16 bits) to be shifted into and out of the device at a programmed bit-transfer rate. The MibSPI/SPI is normally used for communication between the microcontroller and external peripherals or another microcontroller.

Standard SPI and MibSPI modules have the following features:

- 16-bit shift register
- · Receive buffer register
- 8-bit baud clock generator
- SPICLK can be internally-generated (master mode) or received from an external clock source (slave mode)
- · Each word transferred can have a unique format.
- SPI I/Os not used in the communication can be used as digital input/output signals

6.10.5.2 MibSPI Transmit and Receive RAM Organization

The Multibuffer RAM is comprised of 256 buffers. Each entry in the Multibuffer RAM consists of 4 parts: a 16-bit transmit field, a 16-bit receive field, a 16-bit control field and a 16-bit status field. The Multibuffer RAM can be partitioned into multiple transfer group with variable number of buffers each.

Section 6.10.5.2.2 assumes the operating conditions stated in Section 6.10.5.2.1.

6.10.5.2.1 SPI Timing Conditions

		MIN	TYP MAX	UNIT		
Input Con	ditions					
t _R	Input rise time	1	3	ns		
t _F	Input fall time	1	3	ns

⁽¹⁾ The Controller bit (SPIGCRx.0) is set and the CLOCK PHASE bit (SPIFMTx.16) is cleared (where x= 0 or 1).

t_{c(MSS_VCLK)} = main subsystem clock time = 1 / f_(MSS_VCLK). For more details, see the Technical Reference Manual. (2)

When the SPI is in controller mode, the following must be true: For PS values from 1 to 255: $t_{c(SPC)M} \ge (PS + 1)t_{c(MSS_VCLK)} \ge 25$ ns, where PS is the prescale value set in the SPIFMTx.[15:8] register bits. For PS values of 0: $t_{c(SPC)M} = 2t_{c(MSS\ VCLK)} \ge 25$ ns.

The active edge of the SPICLK signal referenced is controlled by the CLOCK POLARITY bit (SPIFMTx.17). (4)

(5) C2TDELAY and T2CDELAY is programmed in the SPIDELAY register

- (1) The MASTER bit (SPIGCRx.0) is cleared (where x = 0 or 1).
- The CLOCK PHASE bit (SPIFMTx.16) is either cleared or set for CLOCK PHASE = 0 or CLOCK PHASE = 1 respectively. (2)
- (3)
- $t_{c(MSS_VCLK)}$ = main subsystem clock time = 1 / $f_{(MSS_VCLK)}$. For more details, see the Technical Reference Manual. When the SPI is in Peripheral mode, the following must be true: For PS values from 1 to 255: $t_{c(SPC)S} \ge (PS + 1)t_{c(MSS_VCLK)} \ge 25$ ns, where PS is the prescale value set in the SPIFMTx.[15:8] register bits.For PS values of 0: $t_{c(SPC)S} = 2t_{c(MSS_VCLK)} \ge 25$ ns. The active edge of the SPICLK signal referenced is controlled by the CLOCK POLARITY bit (SPIFMTx.17).

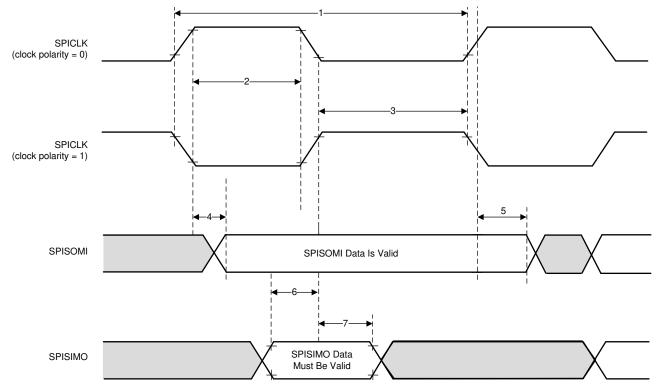

Figure 6-12. SPI Peripheral Mode External Timing (CLOCK PHASE = 0)

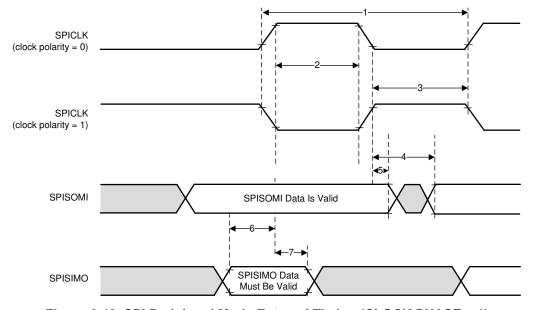

Figure 6-13. SPI Peripheral Mode External Timing (CLOCK PHASE = 1)

6.10.5.4 Typical Interface Protocol Diagram (Slave Mode)

- 1. Host should ensure that there is a delay of two SPI clocks between CS going low and start of SPI clock.
- 2. Host should ensure that CS is toggled for every 16 bits of transfer through SPI.

Figure 6-14 shows the SPI communication timing of the typical interface protocol.

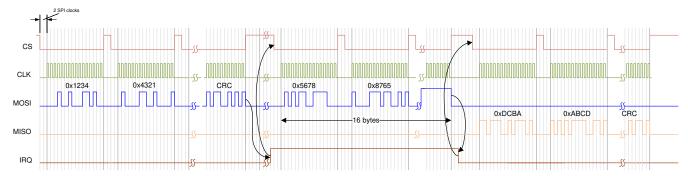

Figure 6-14. SPI Communication

6.10.6 LVDS Interface Configuration

The supported AWR1843AOP LVDS lane configuration is two Data lanes (LVDS_TXP/M), one Bit Clock lane (LVDS_CLKP/M) and one Frame clock lane (LVDS_FRCLKP/M). The LVDS interface is used for debugging. The LVDS interface supports the following data rates:

- 900 Mbps (450 MHz DDR Clock)
- 600 Mbps (300 MHz DDR Clock)
- 450 Mbps (225 MHz DDR Clock)
- 400 Mbps (200 MHz DDR Clock)
- 300 Mbps (150 MHz DDR Clock)
- 225 Mbps (112.5 MHz DDR Clock)
- 150 Mbps (75 MHz DDR Clock)

Note that the bit clock is in DDR format and hence the numbers of toggles in the clock is equivalent to data.

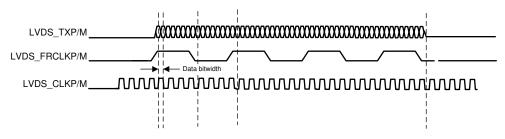

Figure 6-15. LVDS Interface Lane Configuration And Relative Timings

6.10.6.1 LVDS Interface Timings

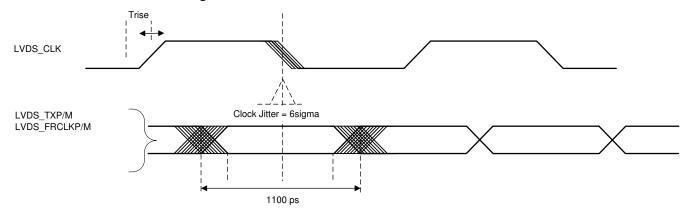

Figure 6-16. Timing Parameters

Table 6-7. LVDS Electrical Characteristics

PARAMETER	TEST CONDITIONS	MIN	TYP MAX	UNIT
Duty Cycle Requirements	max 1 pF lumped capacitive load on LVDS lanes	48%	52%	
Output Differential Voltage	peak-to-peak single-ended with 100 Ω resistive load between differential pairs	250	450	mV
Output Offset Voltage		1125	1275	mV
Trise and Tfall	20%-80%, 900 Mbps		330	ps
Jitter (pk-pk)	900 Mbps		80	ps

6.10.7 General-Purpose Input/Output

Section 6.10.7.1 lists the switching characteristics of output timing relative to load capacitance.

6.10.7.1 Switching Characteristics for Output Timing versus Load Capacitance (C_L)⁽¹⁾ (2)

	PARAMETER	TEST CO	NDITIONS	VIOIN = 1.8V	VIOIN = 3.3V	UNIT
			C _L = 20 pF	2.8	3.0	
t _r	Max rise time		C _L = 50 pF	6.4	6.9	ns
		Slew control = 0	C _L = 75 pF	9.4	10.2	
		Siew control – 0	C _L = 20 pF	2.8	2.8	
t _f	Max fall time		C _L = 50 pF	6.4	6.6	ns
			C _L = 75 pF	9.4	9.8	
			C _L = 20 pF	3.3	3.3	
t _r	Max rise time		C _L = 50 pF	6.7	7.2	ns
		Slow control - 1	C _L = 75 pF	9.6	10.5	
	Max fall time	Max fall time	C _L = 20 pF	3.1	3.1	
t _f			C _L = 50 pF	6.6	6.6	ns
			C _L = 75 pF	9.6	9.6	

Slew control, which is configured by PADxx_CFG_REG, changes behavior of the output driver (faster or slower output slew rate). The rise/fall time is measured as the time taken by the signal to transition from 10% and 90% of VIOIN voltage.

⁽¹⁾ (2)

6.10.8 Controller Area Network Interface (DCAN)

The DCAN supports the CAN 2.0B protocol standard and uses a serial, multimaster communication protocol that efficiently supports distributed real-time control with robust communication rates of up to 1 Mbps. The DCAN is ideal for applications operating in noisy and harsh environments that require reliable serial communication or multiplexed wiring.

The DCAN has the following features:

- · Supports CAN protocol version 2.0 part A, B
- Bit rates up to 1 Mbps
- Configurable Message objects
- Individual identifier masks for each message object
- Programmable FIFO mode for message objects
- · Suspend mode for debug support
- Programmable loop-back modes for self-test operation
- Direct access to Message RAM in test mode
- Supports two interrupt lines Level 0 and Level 1
- Automatic Message RAM initialization

6.10.8.1 Dynamic Characteristics for the DCANx TX and RX Pins

	PARAMETER	MIN	TYP	MAX	UNIT
t _{d(CAN_tx)}	Delay time, transmit shift register to CAN_tx pin ⁽¹⁾			15	ns
t _{d(CAN_rx)}	Delay time, CAN_rx pin to receive shift register ⁽¹⁾			10	ns

(1) These values do not include rise/fall times of the output buffer.

Product Folder Links: AWR1843AOP

6.10.9 Controller Area Network - Flexible Data-rate (CAN-FD)

The CAN-FD module supports both classic CAN and CAN FD (CAN with Flexible Data-Rate) specifications. CAN FD feature allows high throughput and increased payload per data frame. The classic CAN and CAN FD devices can coexist on the same network without any conflict.

The CAN-FD has the following features:

- Conforms with CAN Protocol 2.0 A, B and ISO 11898-1
- Full CAN FD support (up to 64 data bytes per frame)
- AUTOSAR and SAE J1939 support
- Up to 32 dedicated Transmit Buffers
- Configurable Transmit FIFO, up to 32 elements
- Configurable Transmit Queue, up to 32 elements
- Configurable Transmit Event FIFO, up to 32 elements
- · Up to 64 dedicated Receive Buffers
- Two configurable Receive FIFOs, up to 64 elements each
- Up to 128 11-bit filter elements
- Internal Loopback mode for self-test
- · Mask-able interrupts, two interrupt lines
- Two clock domains (CAN clock / Host clock)
- Parity / ECC support Message RAM single error correction and double error detection (SECDED)
 mechanism
- Full Message Memory capacity (4352 words).

6.10.9.1 Dynamic Characteristics for the CANx TX and RX Pins

	PARAMETER	MIN	TYP	MAX	UNIT
t _{d(CAN_FD_tx)}	Delay time, transmit shift register to CAN_FD_tx pin ⁽¹⁾			15	ns
t _{d(CAN_FD_rx)}	Delay time, CAN_FD_rx pin to receive shift register ⁽¹⁾			10	ns

⁽¹⁾ These values do not include rise/fall times of the output buffer.

6.10.10 Serial Communication Interface (SCI)

The SCI has the following features:

- Standard universal asynchronous receiver-transmitter (UART) communication
- Standard non-return to zero (NRZ) format
- Double-buffered receive and transmit functions
- Asynchronous or iso-synchronous communication modes with no CLK pin
- · Capability to use Direct Memory Access (DMA) for transmit and receive data
- Two external pins: RS232_RX and RS232_TX

6.10.10.1 SCI Timing Requirements

		MIN	TYP	MAX	UNIT
f(baud)	Supported baud rate at 20 pF		921.6		kHz

Product Folder Links: AWR1843AOP

6.10.11 Inter-Integrated Circuit Interface (I2C)

The inter-integrated circuit (I2C) module is a multimaster communication module providing an interface between devices compliant with Philips Semiconductor I2C-bus specification version 2.1 and connected by an I²C-bus™. This module will support any slave or master I2C compatible device.

The I2C has the following features:

- Compliance to the Philips I2C bus specification, v2.1 (The I2C Specification, Philips document number 9398 393 40011)
 - Bit/Byte format transfer
 - 7-bit and 10-bit device addressing modes
 - General call
 - START byte
 - Multi-master transmitter/ slave receiver mode
 - Multi-master receiver/ slave transmitter mode
 - Combined master transmit/receive and receive/transmit mode
 - Transfer rates of 100 kbps up to 400 kbps (Phillips fast-mode rate)
- · Free data format
- Two DMA events (transmit and receive)
- · DMA event enable/disable capability
- · Module enable/disable capability
- The SDA and SCL are optionally configurable as general purpose I/O
- Slew rate control of the outputs
- Open drain control of the outputs
- Programmable pullup/pulldown capability on the inputs
- Supports Ignore NACK mode

Note

This I2C module does not support:

- · High-speed (HS) mode
- · C-bus compatibility mode
- The combined format in 10-bit address mode (the I2C sends the slave address second byte every time it sends the slave address first byte)

Submit Document Feedback

6.10.11.1 I2C Timing Requirements⁽¹⁾

		STANDARD	MODE	FAST MODE		UNIT
		MIN	MAX	MIN		UNII
t _{c(SCL)}	Cycle time, SCL	10		2.5		μs
t _{su(SCLH-SDAL)}	Setup time, SCL high before SDA low (for a repeated START condition)	4.7		0.6		μs
t _{h(SCLL-SDAL)}	Hold time, SCL low after SDA low (for a START and a repeated START condition)	4		0.6		μs
t _{w(SCLL)}	Pulse duration, SCL low	4.7		1.3		μs
t _{w(SCLH)}	Pulse duration, SCL high	4		0.6		μs
t _{su(SDA-SCLH)}	Setup time, SDA valid before SCL high	250		100		μs
t _{h(SCLL-SDA)}	Hold time, SDA valid after SCL low	0	3.45 ⁽¹⁾	0	0.9	μs
t _{w(SDAH)}	Pulse duration, SDA high between STOP and START conditions	4.7		1.3		μs
t _{su(SCLH-SDAH)}	Setup time, SCL high before SDA high (for STOP condition)	4		0.6		μs
t _{w(SP)}	Pulse duration, spike (must be suppressed)			0	50	ns
C _b (2) (3)	Capacitive load for each bus line		400		400	pF

- (1) The I2C pins SDA and SCL do not feature fail-safe I/O buffers. These pins could potentially draw current when the device is powered down.
- (2) The maximum th(SDA-SCLL) for I2C bus devices has only to be met if the device does not stretch the low period (tw(SCLL)) of the SCL signal.
- (3) C_b = total capacitance of one bus line in pF. If mixed with fast-mode devices, faster fall-times are allowed.

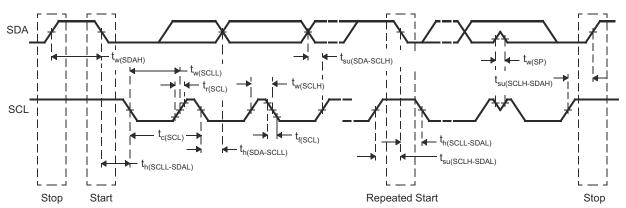

Figure 6-17. I2C Timing Diagram

Note

- A device must internally provide a hold time of at least 300 ns for the SDA signal (referred to the VIHmin of the SCL signal) to bridge the undefined region of the falling edge of SCL.
- The maximum th(SDA-SCLL) has only to be met if the device does not stretch the LOW period (tw(SCLL)) of the SCL signal. E.A Fast-mode I2C-bus device can be used in a Standard-mode I2C-bus system, but the requirement t_{su(SDA-SCLH)} ≥ 250 ns must then be met. This will automatically be the case if the device does not stretch the LOW period of the SCL signal. If such a device does stretch the LOW period of the SCL signal, it must output the next data bit to the SDA line tr max + t_{su(SDA-SCLH)}.

6.10.12 Quad Serial Peripheral Interface (QSPI)

The quad serial peripheral interface (QSPI™) module is a kind of SPI module that allows single, dual, or quad read access to external SPI devices. This module has a memory mapped register interface, which provides a direct interface for accessing data from external SPI devices and thus simplifying software requirements. The QSPI works as a master only. The QSPI in the device is primarily intended for fast booting from guad-SPI flash memories.

The QSPI supports the following features:

- Programmable clock divider
- Six-pin interface
- Programmable length (from 1 to 128 bits) of the words transferred
- Programmable number (from 1 to 4096) of the words transferred
- Support for 3-, 4-, or 6-pin SPI interface
- Optional interrupt generation on word or frame (number of words) completion
- Programmable delay between chip select activation and output data from 0 to 3 QSPI clock cycles

Section 6.10.12.2 and Section 6.10.12.3 assume the operating conditions stated in Section 6.10.12.1.

6.10.12.1 QSPI Timing Conditions

		MIN	TYP MAX	UNIT
Input Condi	tions			
t _R	Input rise time	1	3	ns
t _F	Input fall time	1	3	ns
Output Con	ditions			
C _{LOAD}	Output load capacitance	2	15	pF

6.10.12.2 Timing Requirements for QSPI Input (Read) Timings⁽¹⁾ (2)

		MIN	TYP MAX	UNIT
t _{su(D-SCLK)}	Setup time, d[3:0] valid before falling sclk edge (Q12)	7.3		ns
t _{h(SCLK-D)}	Hold time, d[3:0] valid after falling sclk edge (Q13)	1.5		ns
t _{su(D-SCLK)}	Setup time, final d[3:0] bit valid before final falling sclk edge	7.3 – P ⁽³⁾		ns
t _{h(SCLK-D)}	Hold time, final d[3:0] bit valid after final falling sclk edge	1.5 + P ⁽³⁾		ns

- (1) Clock Mode 0 (clk polarity = 0; clk phase = 0) is the mode of operation.
- The Device captures data on the falling clock edge in Clock Mode 0, as opposed to the traditional rising clock edge. Although non-standard, the falling-edge-based setup and hold time timings have been designed to be compatible with standard SPI devices that launch data on the falling edge in Clock Mode 0.

Product Folder Links: AWR1843AOP

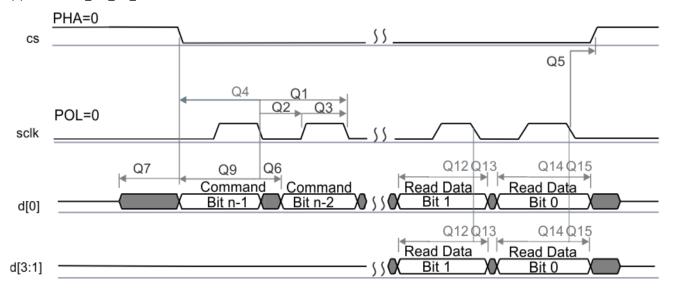

(3) P = SCLK period in ns.

6.10.14 Data Modification Module (DMM)

A Data Modification Module (DMM) gives the ability to write external data into the device memory.

The DMM has the following features:

- Acts as a bus master, thus enabling direct writes to the 4GB address space without CPU intervention
- Writes to memory locations specified in the received packet (leverages packets defined by trace mode of the RAM trace port [RTP] module)
- Writes received data to consecutive addresses, which are specified by the DMM (leverages packets defined by direct data mode of RTP module)
- Configurable port width (1, 2, 4, 8, 16 pins)
- Up to 65 Mbit/s pin data rate

7 Detailed Description

7.1 Overview

The AWR1843AOP is an Antenna-on-Package (AOP) device that includes the entire Millimeter Wave blocks and analog baseband signal chain for three transmitters and four receivers, as well as a customer-programmable MCU. This device is applicable as a radar-on-a-chip in use-cases with modest requirements for memory, processing capacity and application code size. These could be cost-sensitive automotive applications that are evolving from 24 GHz narrowband implementation and some emerging simple ultra-short-range radar applications. Typical application examples for this device include Car Door Opener, Parking Assist, basic Blind Spot Detect and so forth.

In terms of scalability, the AWR1843AOP device could be paired with a low-end external MCU, to address more complex applications that might require additional memory for larger application software footprint and faster interfaces.

7.2 Functional Block Diagram

7.3 Subsystems

7.3.1 RF and Analog Subsystem

The RF and analog subsystem includes the RF and analog circuitry – namely, the synthesizer, PA, LNA, mixer, IF, and ADC. This subsystem also includes the crystal oscillator and temperature sensors. The three transmit channels can be operated up to a maximum of two at a time (simultaneously) for transmit beamforming purpose as required; whereas the four receive channels can all be operated simultaneously.

7.3.1.1 Clock Subsystem

The AWR1843AOP clock subsystem generates 76 to 81 GHz from an input reference of 40-MHz crystal. It has a built-in oscillator circuit followed by a clean-up PLL and a RF synthesizer circuit. The output of the RF synthesizer is then processed by an X4 multiplier to create the required frequency in the 76 to 81 GHz spectrum. The RF synthesizer output is modulated by the timing engine block to create the required waveforms for effective sensor operation.

The clean-up PLL also provides a reference clock for the host processor after system wakeup.

The clock subsystem also has built-in mechanisms for detecting the presence of a crystal and monitoring the quality of the generated clock.

Figure 7-1 describes the clock subsystem.

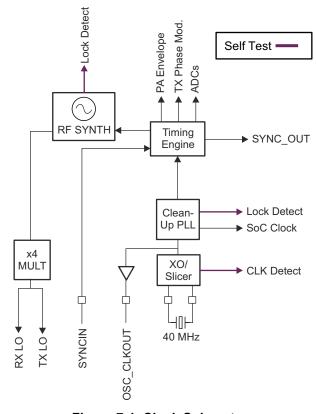

Figure 7-1. Clock Subsystem

7.3.1.2 Transmit Subsystem

The AWR1843AOP transmit subsystem consists of three parallel transmit chains, each with independent phase and amplitude control. All three transmitters can be used simultaneously. For AWR1843AOP, additional phase shifters are associated with Tx channels, and these can programmed on a per chirp basis.

Each transmit chain can deliver a maximum of 16 dBm EIRP. The transmit chains also support programmable backoff for system optimization.

Figure 7-2 describes the transmit subsystem.

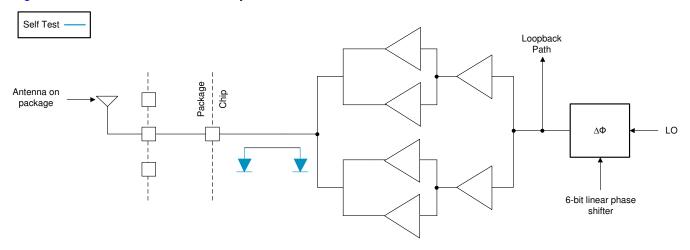

Figure 7-2. Transmit Subsystem (Per Channel)

7.3.1.3 Receive Subsystem

The AWR1843AOP receive subsystem consists of four parallel channels. A single receive channel consists of an LNA, mixer, IF filtering, ADC conversion, and decimation. All four receive channels can be operational at the same time an individual power-down option is also available for system optimization.

Unlike conventional real-only receivers, the AWR1843AOP device supports a complex baseband architecture, which uses quadrature mixer and dual IF and ADC chains to provide complex I and Q outputs for each receiver channel. The AWR1843AOP is targeted for fast chirp systems. The band-pass IF chain has configurable lower cutoff frequencies above 175 kHz and can support bandwidths up to 10 MHz.

Figure 7-3 describes the receive subsystem.

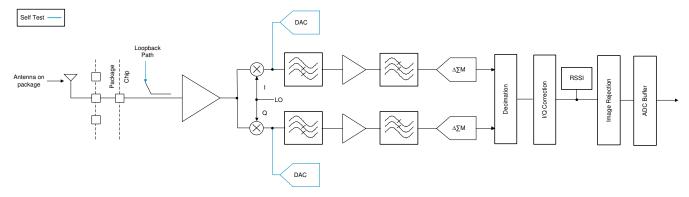

Figure 7-3. Receive Subsystem (Per Channel)

Copyright © 2024 Texas Instruments Incorporated

7.3.2 Processor Subsystem

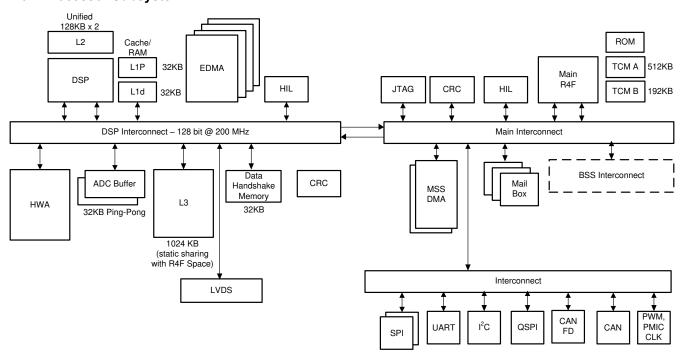

Figure 7-4. Processor Subsystem

Figure 7-4 shows the block diagram for customer programmable processor subsystems in the AWR1843AOP device. At a high level there are two customer programmable subsystems. Left hand side shows the DSP Subsystem which contains TI's high-performance C674x DSP, a high-bandwidth interconnect for high performance (128-bit, 200MHz) and associated peripherals – four DMAs for data transfer,

LVDS interface for Measurement data output, L3 Radar data cube memory, ADC buffers, CRC engine, and data handshake memory (additional memory provided on interconnect).

The right side of the diagram shows the Main subsystem. Main subsystem as name suggests is the main device and controls all the device peripherals and house-keeping activities of the device. Main subsystem contains Cortex-R4F (MSS R4F) processor and associated peripherals and house-keeping components such as DMAs, CRC and Peripherals (I²C, UART, SPIs, CAN, PMIC clocking module, PWM, and others) connected to Main Interconnect through Peripheral Central Resource (PCR interconnect).

Details of the DSP CPU core can be found at http://www.ti.com/product/TMS320C6748.

HIL module is shown in both the subsystems and can be used to perform the radar operations feeding the captured data from outside into the device without involving the RF subsystem. HIL on MSS is for controlling the configuration and HIL on DSPSS for high speed ADC data input to the device. Both HIL modules uses the same IOs on the device, one additional IO (DMM_MUX_IN) allows selecting either of the two.

7.3.3 Automotive Interface

The AWR1843AOP communicates with the automotive network over the following main interfaces:

CAN (2 interfaces available, one of them being CAN-FD)

7.3.4 Main Subsystem Cortex-R4F Memory Map

Table 7-1 shows the main subsystem, Cortex-R4F memory map.

Note

There are separate Cortex-R4F addresses and DMA MSS addresses for the main subsystem. See the Technical Reference Manual for a complete list.

7.4 Other Subsystems

7.4.1 ADC Channels (Service) for User Application

The AWR1843AOP device includes provision for an ADC service for user application, where the

GPADC engine present inside the device can be used to measure up to six external voltages. The ADC1, ADC2, ADC3, ADC4, ADC5, and ADC6 pins are used for this purpose.

- ADC itself is controlled by TI firmware running inside the BIST subsystem and access to it for customer's
 external voltage monitoring purpose is via 'monitoring API' calls routed to the BIST subsystem. This API
 could be linked with the user application running on the MSS R4F.
- BIST subsystem firmware will internally schedule these measurements along with other ¹RF and Analog monitoring operations. The API allows configuring the settling time (number of ADC samples to skip) and number of consecutive samples to take. At the end of a frame, the minimum, maximum and average of the readings will be reported for each of the monitored voltages.

GPADC Specifications:

- 625 Ksps SAR ADC
- 0 to 1.8V input range
- 10-bit resolution
- For 5 out of the 6 inputs, an optional internal buffer is available. Without the buffer, the ADC has a switched
 capacitor input load modeled with 5pF of sampling capacitance and 12pF parasitic capacitance (GPADC
 channel 6, the internal buffer is not available).

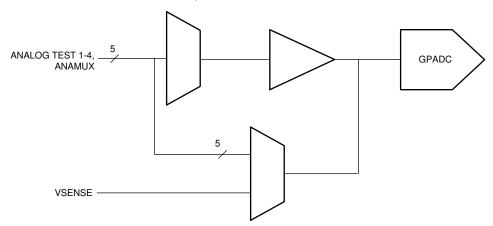

Figure 7-5. ADC Path

7.4.1.1 GP-ADC Parameter

over operating free-air temperature range (unless otherwise noted)

PARAMETER	TYP	UNIT
ADC supply	1.8	V
ADC unbuffered input voltage range	0 – 1.8	V
ADC buffered input voltage range ⁽¹⁾	0.4 – 1.3	V
ADC resolution	10	bits
ADC offset error	±5	LSB
ADC gain error	±5	LSB
ADC DNL	-1/+2.5	LSB
ADC INL	±2.5	LSB
ADC sample rate ⁽²⁾	625	Ksps

GPADC structures are used for measuring the output of internal temperature sensors. The accuracy of these measurements is ±7°C

over operating free-air temperature range (unless otherwise noted)

PARAMETER	TYP	UNIT
ADC sampling time ⁽²⁾	400	ns
ADC internal cap	10	pF
ADC buffer input capacitance	2	pF
ADC input leakage current	3	uA

- (1) Outside of given range, the buffer output will become nonlinear.
- (2) ADC itself is controlled by TI firmware running inside the BIST subsystem. For more details please refer to the API calls.

Submit Document Feedback

8 Monitoring and Diagnostics

8.1 Monitoring and Diagnostic Mechanisms

Below is the list given for the main monitoring and diagnostic mechanisms available in the Functional Safety-Compliant AWR1843AOP device.

Table 8-1. Monitoring and Diagnostic Mechanisms for Functional Safety-Compliant AWR1843AOP device

	Table 8-1. Monitoring and Diagnostic Mechanisms for Functional Safety-Compliant AWR1843AOP device				
S No	Feature	Description			
1	Boot time LBIST For MSS R4F Core and associated VIM	AWR1843AOP architecture supports hardware logic BIST (LBIST) engine self-test Controller (STC). This logic is used to provide a very high diagnostic coverage (>90%) on the MSS R4F CPU core and Vectored Interrupt Module (VIM) at a transistor level. LBIST for the CPU and VIM need to be triggered by application code before starting the functional safety application. CPU stays there in while loop and does not proceed further if a fault is identified.			
2	Boot time PBIST for MSS R4F TCM Memories	MSS R4F has three Tightly coupled Memories (TCM) memories TCMA, TCMB0 and TCMB1. AWR1843AOP architecture supports a hardware programmable memory BIST (PBIST) engine. This logic is used to provide a very high diagnostic coverage (March-13n) on the implemented MSS R4F TCMs at a transistor level. PBIST for TCM memories is triggered by Bootloader at the boot time before starting download of application from Flash or peripheral interface. CPU stays there in while loop and does not proceed further if a fault is identified.			
3	End to End ECC for MSS R4F TCM Memories	TCMs diagnostic is supported by Single error correction double error detection (SECDED) ECC diagnostic. An 8-bit code word is used to store the ECC data as calculated over the 64-bit data bus. ECC evaluation is done by the ECC control logic inside the CPU. This scheme provides end-to-end diagnostics on the transmissions between CPU and TCM. CPU can be configured to have predetermined response (Ignore or Abort generation) to single and double bit error conditions.			
4	MSS R4F TCM bit multiplexing	Logical TCM word and its associated ECC code is split and stored in two physical SRAM banks. This scheme provides an inherent diagnostic mechanism for address decode failures in the physical SRAM banks. Faults in the bank addressing are detected by the CPU as an ECC fault. Further, bit multiplexing scheme implemented such that the bits accessed to generate a logical (CPU) word are not physically adjacent. This scheme helps to reduce the probability of physical multi-bit faults resulting in logical multi-bit faults; rather they manifest as multiple single bit faults. As the SECDED TCM ECC can correct a single bit fault in a logical word, this scheme improves the usefulness of the TCM ECC diagnostic. Both these features are hardware features and cannot be enabled or disabled by application software.			
5	Clock Monitor	AWR1843AOP architecture supports Three Digital Clock Comparators (DCCs) and an internal RCOSC. Dual functionality is provided by these modules – Clock detection and Clock Monitoring. DCCint is used to check the availability/range of Reference clock at boot otherwise the device is moved into limp mode (Device still boots but on 10MHz RCOSC clock source. This provides debug capability). DCCint is only used by boot loader during boot time. It is disabled once the APLL is enabled and locked. DCC1 is dedicated for APLL lock detection monitoring, comparing the APLL output divided version with the Reference input clock of the device. Initially (before configuring APLL), DCC1 is used by bootloader to identify the precise frequency of reference input clock against the internal RCOSC clock source. Failure detection for DCC1 would cause the device to go into limp mode. DCC2 module is one which is available for user software. From the list of clock options given in detailed spec, any two clocks can be compared. One example usage is to compare the CPU clock with the Reference or internal RCOSC clock source. Failure detection is indicated to the MSS R4F CPU via Error Signaling Module (ESM).			
7	RTI/WD for MSS R4F	AWR1843AOP architecture supports the use of an internal watchdog that is implemented in the real-time interrupt (RTI) module. The internal watchdog has two modes of operation: digital watchdog (DWD) and digital windowed watchdog (DWWD). The modes of operation are mutually exclusive; the designer can elect to use one mode or the other but not both at the same time. Watchdog can issue either an internal (warm) system reset or a CPU non-mask able interrupt upon detection of a failure. The Watchdog is enabled by the bootloader in DWD mode at boot time to track the boot process. Once the application code takes up the control, Watchdog can be configured again for mode and timings based on specific customer requirements.			

Copyright © 2024 Texas Instruments Incorporated

Table 8-1. Monitoring and Diagnostic Mechanisms for Functional Safety-Compliant AWR1843AOP device (continued)

S No	Feature	Description	
8	MPU for MSS R4F	Cortex-R4F CPU includes an MPU. The MPU logic can be used to provide spatial separation of software tasks in the device memory. Cortex-R4F MPU supports 12 regions. It is expected that the operating system controls the MPU and changes the MPU settings based on the needs of each task. A violation of a configured memory protection policy results in a CPU abort.	
9	PBIST for Peripheral interface SRAMs - SPIs, CANs	AWR1843AOP architecture supports a hardware programmable memory BIST (PBIST) engine for Peripheral SRAMs as well. PBIST for peripheral SRAM memories can be triggered by the application. User can elect to run the PBIST on one SRAM or on groups of SRAMs based on the execution time, which can be allocated to the PBIST diagnostic. The PBIST tests are destructive to memory contents, and as such are typically run only at boot time. However, the user has the freedom to initiate the tests at any time if peripheral communication can be hindered. Any fault detected by the PBIST results in an error indicated in PBIST status registers.	
10	ECC for Peripheral interface SRAMs – SPIs, CANs	Peripheral interface SRAMs diagnostic is supported by Single error correction double error detection (SECDED) ECC diagnostic. When a single or double bit error is detected the MSS R4F is notified via ESM (Error Signaling Module). This feature is disabled after reset. Software must configure and enable this feature in the peripheral and ESM module. ECC failure (both single bit corrected and double bit uncorrectable error conditions) is reported to the MSS R4F as an interrupt via ESM module.	
11	Configuration registers protection for MSS peripherals	All the MSS peripherals (SPIs, CANs, I2C, DMAs, RTI/WD, DCCs, IOMUX etc.) are connected to interconnect via Peripheral Central resource (PCR). This provides two diagnostic mechanisms that can limit access to peripherals. Peripherals can be clock gated per peripheral chip select in the PCR. This can be utilized to disable unused features such that they cannot interfere. In addition, each peripheral chip select can be programmed to limit access based on privilege level of transaction. This feature can be used to limit access to entire peripherals to privileged operating system code only. These diagnostic mechanisms are disabled after reset. Software must configure and enable these mechanisms. Protection violation also generates an 'error' that result in abort to MSS R4F or error response to other masters such as DMAs.	
12	Cyclic Redundancy Check – MSS	AWR1843AOP architecture supports hardware CRC engine on MSS implementing the below polynomials. CRC16 CCITT – 0x10 CRC32 Ethernet – 0x04C11DB7 CRC64 CRC 32C – CASTAGNOLI – 0x1EDC6F4 CRC32P4 – E2E Profile4 – 0xF4ACFB1 CRC-8 – H2F Autosar – 0x2F CRC-8 – VDA CAN – 0x1D The read operation of the SRAM contents to the CRC can be done by CPU or by DMA. The comparison of results, indication of fault, and fault response are the responsibility of the software managing the test.	
13	MPU for DMAs	AWR1843AOP architecture supports MPUs on MSS DMAs. Failure detection by MPU is reported to the MSS R4F CPU core as an interrupt via ESM. DSPSS's high performance EDMAs also includes MPUs on both read and writes master ports. EDMA MPUs supports 8 regions. Failure detection by MPU is reported to the DSP core as an interrupt via local ESM.	
14	Boot time LBIST For BIST R4F Core and associated VIM	AWR1843AOP architecture supports hardware logic BIST (LBIST) even for BIST R4F core and associated VIM module. This logic provides very high diagnostic coverage (>90%) on the BIST R4F CPU core and VIM. This is triggered by MSS R4F boot loader at boot time and it does not proceed further if the fault is detected.	
15	Boot time PBIST for BIST R4F TCM Memories	AWR1843AOP architecture supports a hardware programmable memory BIST (PBIST) engine for BIST R4F TCMs which provide a very high diagnostic coverage (March-13n) on the BIST R4F TCMs. PBIST is triggered by MSS R4F Bootloader at the boot time and it does not proceed further if the fault is detected.	

Submit Document Feedback

Table 8-1. Monitoring and Diagnostic Mechanisms for Functional Safety-Compliant AWR1843AOP device (continued)

(continued)									
S No	Feature	Description							
16	End to End ECC for BIST R4F TCM Memories	BIST R4F TCMs diagnostic is supported by Single error correction double error detection (SECDED) ECC diagnostic. Single bit error is communicated to the BIST R4FCPU while double bit error is communicated to MSS R4F as an interrupt so that application code becomes aware of this and takes appropriate action.							
17	BIST R4F TCM bit multiplexing	Logical TCM word and its associated ECC code is split and stored in two physical SRAM panks. This scheme provides an inherent diagnostic mechanism for address decode failures in the physical SRAM banks and helps to reduce the probability of physical multi-bit faults resulting in logical multi-bit faults.							
18	RTI/WD for BIST R4F	Device architecture supports an internal watchdog for BIST R4F. Timeout condition is reported via an interrupt to MSS R4F and rest is left to application code to either go for SW reset for BIST SS or warm reset for the device to come out of faulty condition.							
19	Boot time PBIST for L1P, L1D, L2 and L3 Memories	Device architecture supports a hardware programmable memory BIST (PBIST) engine for DSPSS's L1P, L1D, L2 and L3 memories which provide a very high diagnostic coverage (March-13n). PBIST is triggered by MSS R4F Bootloader at the boot time and it does not proceed further if the fault is detected.							
20	Parity on L1P	Device architecture supports Parity diagnostic on DSP's L1P memory. Parity error is reported to the CPU as an interrupt. Note:- L1D memory is not covered by parity or ECC and need to be covered by application level diagnostics.							
21	ECC on DSP's L2 Memory	Device architecture supports both Parity Single error correction double error detection (SECDED) ECC diagnostic on DSP's L2 memory. L2 Memory is a unified 256KB of memory used to store program and Data sections for the DSP. A 12-bit code word is used to store the ECC data as calculated over the 256-bit data bus (logical instruction fetch size). The ECC logic for the L2 access is located in the DSP and evaluation is done by the ECC control logic inside the DSP. This scheme provides end-to-end diagnostics on the transmissions between DSP and L2. Byte aligned Parity mechanism is also available on L2 to take care of data section.							
22	ECC on Radar Data Cube (L3) Memory	L3 memory is used as Radar data section in Device. Device architecture supports Single error correction double error detection (SECDED) ECC diagnostic on L3 memory. An 8-bit code word is used to store the ECC data as calculated over the 64-bit data bus. Failure detection by ECC logic is reported to the MSS R4F CPU core as an interrupt via ESM.							
23	RTI/WD for DSP Core	Device architecture supports the use of an internal watchdog for BIST R4F that is implemented in the real-time interrupt (RTI) module – replication of same module as used in MSS. This module supports same features as that of RTI/WD for MSS/BIST R4F. This watchdog is enabled by customer application code and Timeout condition is reported via an interrupt to MSS R4F and rest is left to application code in MSS R4F to either go for SW reset for DSP SS or warm reset for the device to come out of faulty condition.							
24	CRC for DSP Sub-System	Device architecture supports dedicated hardware CRC on DSPSS implementing the below polynomials. CRC16 CCITT - 0x10 CRC32 Ethernet - 0x04C11DB7 CRC64 The read of SRAM contents to the CRC can be done by DSP CPU or by DMA. The comparison of results, indication of fault, and fault response are the responsibility of the software managing the test.							
25	MPU for DSP	Device architecture supports MPUs for DSP memory accesses (L1D, L1P, and L2). L2 memory supports 64 regions and 16 regions for L1P and L1D each. Failure detection by MPU is reported to the DSP core as an abort.							
26	Temperature Sensors	Device architecture supports various temperature sensors all across the device (next to power hungry modules such as PAs, DSP etc) which is monitored during the inter-frame period. ⁽¹⁾							
27	Tx Power Monitors	Device architecture supports power detectors at the Tx output. (2)							
	-								

Table 8-1. Monitoring and Diagnostic Mechanisms for Functional Safety-Compliant AWR1843AOP device (continued)

S No	Feature	Description							
28	Error Signaling Error Output	When a diagnostic detects a fault, the error must be indicated. The Device architecture provides aggregation of fault indication from internal monitoring/diagnostic mechanisms using a peripheral logic known as the Error Signaling Module (ESM). The ESM provides mechanisms to classify errors by severity and to provide programmable error response. ESM module is configured by customer application code and specific error signals can be enabled or masked to generate an interrupt (Low/High priority) for the MSS R4F CPU. Device supports Nerror output signal (IO) which can be monitored externally to identify any kind of high severity faults in the design which could not be handled by the R4F.							
29	Synthesizer (Chirp) frequency monitor	Monitors Synthesizer's frequency ramp by counting (divided-down) clock cycles and comparing to ideal frequency ramp. Excess frequency errors above a certain threshold, if any, are detected and reported.							
30	Ball break detection for TX ports (TX Ball break monitor)	Device architecture supports a ball break detection mechanism based on Impedance measurement at the TX output(s) to detect and report any large deviations that can indicate a ball break. Monitoring is done by TIs code running on BIST R4F and failure is reported to the MSS R4F via Mailbox. It is completely up to customer SW to decide on the appropriate action based on the message from BIST R4F.							
31	RX loopback test	Built-in TX to RX loopback to enable detection of failures in the RX path(s), including Gain/Noise figure, inter-RX balance, etc.							
32	IF loopback test	Built-in IF (square wave) test tone input to monitor IF filter's frequency response and detect failure.							
33	RX saturation detect	Provision to detect ADC saturation due to excessive incoming signal level and/or interference.							
34	Boot time LBIST for DSP core	Device supports boot time LBIST for the DSP Core. LBIST can be triggered by the MSS R4F application code during boot time.							

- (1) Monitoring is done by the Tl's code running on BIST R4F. There are two modes in which it could be configured to report the temperature sensed via API by customer application.
 - a. Report the temperature sensed after every N frames
 - b. Report the condition once the temperature crosses programmed threshold.

It is completely up to customer SW to decide on the appropriate action based on the message from BIST R4Fvia Mailbox.

(2) Monitoring is done by the TI's code running on BIST R4F.

There are two modes in which it could be configured to report the detected output power via API by customer application.

- Report the power detected after every N frames
- b. Report the condition once the output power degrades by more than configured threshold from the configured.

It is completely up to customer SW to decide on the appropriate action based on the message from BIST R4F.

Note

Refer to the Device Safety Manual or other relevant collaterals for more details on applicability of all diagnostics mechanisms. For Certification details, refer to the Device product folder.

8.1.1 Error Signaling Module

When a diagnostic detects a fault, the error must be indicated. AWR1843AOP architecture provides aggregation of fault indication from internal diagnostic mechanisms using a peripheral logic known as the error signaling module (ESM). The ESM provides mechanisms to classify faults by severity and allows programmable error response. Below is the high level block diagram for ESM module.

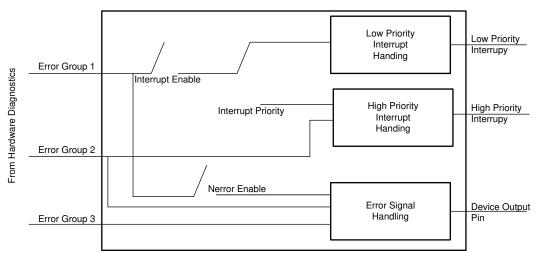

Figure 8-1. ESM Module Diagram

9 Applications, Implementation, and Layout

Note

Information in the following Applications section is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

Application information can be found on AWR Application web page.

9.2 Reference Schematic

The reference schematic and power supply information can be found in the AWR1843AOP EVM Documentation.

Listed for convenience are: Design Files, Schematics, Layouts, and Stack up for PCB.

- Altium AWR1843AOP EVM Design Files
- AWR1843AOP EVM Schematic Drawing, Assembly Drawing, and Bill of Materials

10 Device and Documentation Support

TI offers an extensive line of development tools. Tools and software to evaluate the performance of the device, generate code, and develop solutions follow.

10.1 Device Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all microprocessors and support tools. Each device has one of three prefixes: X, P, or null (no prefix) (for example, *AWR1843AOP*). Texas Instruments recommends two of three possible prefix designators for its support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (TMDX) through fully qualified production devices and tools (TMDS).

Device development evolutionary flow:

- **X** Experimental device that is not necessarily representative of the final device's electrical specifications and may not use production assembly flow.
- **P** Prototype device that is not necessarily the final silicon die and may not necessarily meet final electrical specifications.

null Production version of the silicon die that is fully qualified.

Support tool development evolutionary flow:

TMDX Development-support product that has not yet completed Texas Instruments internal qualification testing. **TMDS** Fully-qualified development-support product.

X and P devices and TMDX development-support tools are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

Production devices and TMDS development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. Tl's standard warranty applies.

Predictions show that prototype devices (X or P) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the package type (for example, ALP0180A), the temperature range (for example, blank is the default commercial temperature range). Figure 10-1 provides a legend for reading the complete device name for any AWR1843AOP device.

For orderable part numbers of *AWR1843AOP* devices in the ALP0180 package types, see the Package Option Addendum of this document, the TI website (www.ti.com), or contact your TI sales representative.

For additional description of the device nomenclature markings on the die, see the AWR1843AOP Device Errata.

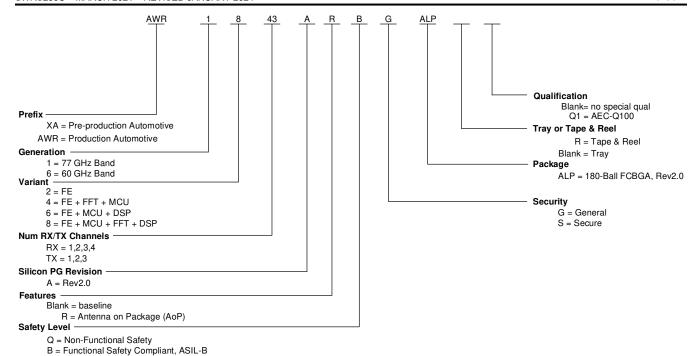

Figure 10-1. Device Nomenclature

Note

The silicon revision information, Rev2.0, is different from the device revision information, ES1.0, mentioned in the Errata document. The device revision information ES1.0 is related to both silicon and package revisions.

10.2 Tools and Software

Models

AWR1843AOP IBIS model IO buffer information model for the IO buffers of the device. For simulation on a circuit board, see IBIS Open Forum.

10.3 Documentation Support

To receive notification of documentation updates, navigate to the device product folder on ti.com. Click on *Notifications* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

The current documentation that describes the DSP, related peripherals, and other technical collateral follows.

Errata

AWR1843AOP device errata Describes known advisories, limitations, and cautions on silicon and provides workarounds.

10.4 Support Resources

TI E2E[™] support forums are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

10.5 Trademarks

TI E2E[™] is a trademark of Texas Instruments.

www.ti.com

Arm® and Cortex® are registered trademarks of Arm Limited (or its subsidiaries) in the US and/or elsewhere. All trademarks are the property of their respective owners.

10.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

10.7 Glossary

TI Glossary

This glossary lists and explains terms, acronyms, and definitions.

11 Revision History

hanges from July 20, 2022 to January 30, 2024 (from Revision B (July 2022) to Revision C anuary 2024))	age
(Functional Block Diagram) :Updated multiplier next to synthesizer to x4	
(Functional Block Diagram) :Updated multiplier next to synthesizer to x4	. 60
hanges from September 15, 2021 to July 20, 2022 (from Revision A (September 2021) to	
evision B (July 2022)) Pa	age
(Features): Updated/changed the TX power and RX noise	1
Global: Updated to reflect Functional Safety-Compliance	
(Features): Updated Functional-Safety Compliance Certification Collateral; Mentioned the specific operation	
temperature range for the mmWave Sensor; Additional information on Device Security updated	1
(Applications): Add a system block diagram	1
(Device Comparison): Added a table-note for Functional-safety Compliance and LVDS Interface; Additional	
information on Device security aslo added	5
Updated/changed temperature range max for Crystal Electrical Characteristics (Oscillator Mode)	39
(Table. External Clock Mode Specifications): Revised frequency tolerance specs from +/-50 to +/-100 ppm (Monitoring and Diagnostic Mechanisms): Updated/Changed table header and description to reflect	. 39
Functional Safety-Compliance; added a note for reference to safety related collateral	. 71

12 Mechanical, Packaging, and Orderable Information 12.1 Packaging Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

CAUTION

The following package information is subject to change without notice.

Note

Variability in the color (or appearance) of Texas Instrument's (TI's) Antenna-on-Package (AoP) product is normal and expected. This variation is not indicative of any degradation or variability to the performance specifications of the AoP products.

⁽¹⁾ Status: For more details on status, see our product life cycle.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

⁽²⁾ Material type: When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ RoHS values: Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

⁽⁴⁾ Lead finish/Ball material: Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ MSL rating/Peak reflow: The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ Part marking: There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

PACKAGE OPTION ADDENDUM
