

bq25703A SLUSCU1A-MAY 2017-REVISED MAY 2018

bg25703A I2C Multi-Chemistry Battery Buck-Boost Charge Controller With System Power **Monitor and Processor Hot Monitor**

Features

- Charge 1- to 4-Cell Battery From Wide Range of Input Sources
 - 3.5-V to 24-V Input Operating Voltage
 - Supports USB2.0, USB 3.0, USB 3.1 (Type C), and USB_PD Input Current Settings
 - Seamless Transition Between Buck and Boost Operation
 - Input Current and Voltage Regulation (IDPM) and VDPM) Against Source Overload
- Power/Current Monitor for CPU Throttling
 - Comprehensive PROCHOT Profile, IMVP8 Compliant
 - Input and Battery Current Monitor
 - System Power Monitor, IMVP8 Compliant
- Narrow-VDC (NVDC) Power Path Management
 - Instant-On With No Battery or Deeply Discharged Battery
 - Battery Supplements System When Adapter is Fully-Loaded
- Power Up USB Port From Battery (USB OTG)
 - Output 4.48-V to 20.8-V Compatible With USB
 - Output Current Limit up to 6.35 A
- 800-kHz or 1.2-MHz Programmable Switching Frequency for 1-µH to 3.3-µH Inductor
- Host Control Interface for Flexible System Configuration
 - I2C (bq25703A) Port for Optimal System Performance and Status Reporting
 - Hardware Pin to Set Input Current Limit Without EC Control
- Integrated ADC to Monitor Voltage, Current and Power
- High Accuracy Regulation and Monitor
 - ±0.5% Charge Voltage Regulation
 - ±2% Input/Charge Current Regulation
 - ±2% Input/Charge Current Monitor
 - ±5% Power Monitor
- Safety
 - Thermal Shutdown
 - Input, System, Battery Overvoltage Protection
 - **MOSFET Inductor Overcurrent Protection**
- Low Battery Quiescent Current

- Input Current Optimizer (ICO) to Extract Max Input Power
- Charge Any Battery Chemistry: Li+, LiFePO4, NiCd, NiMH, Lead Acid
- Package: 32-Pin 4 x 4 WQFN

2 Applications

- Drones, Bluetooth Speakers, IP Cameras, Detachable, Tablet PCs and Power Bank
- Industrial and Medical Equipment
- Portable Equipment With Rechargeable Batteries

3 Description

The bq25703A is a synchronous NVDC battery buckboost charge controller, offering low component count, high efficiency solution for space-constraint, multi-chemistry battery charging applications.

The NVDC-1 configuration allows the system to be regulated at battery voltage, but not drop below system minimum voltage. The system keeps operating even when the battery is completely discharged or removed. When load power exceeds input source rating, the battery goes into supplement mode and prevents the system from crashing.

The bg25703A charges battery from a wide range of input sources including USB adapter, high voltage USB PD sources and traditional adapters.

Device Information (1)

PART NUMBER	PACKAGE	BODY SIZE (NOM)
bq25703A	WQFN (32)	4.00 mm × 4.00 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

CI	nanges from Original (May 2017) to Revision A	Page
•	Deleted Ideal Diode Operation in Supplement Mode from Features	1
•	Changed 2.2-µH to 3.3-µH and deleted Low Profile in Features	1
•	Added Integrated ADC to Monitor Voltage, Current and Power to Features	1
•	Added Detachable, Tablet PCs and Power Bank to Applications	
•	Changed input source from being overloaded to system from crashing in Description	1
•	Changed 703 I2C to 703A I2C in Application Diagram	1
•	Changed 18.5 V for 3-cell to 19.5 V for 3-cell and 4-cell in CELL_BATPRESZ description	6
•	Changed I to O for CMPOUT I/O	7
•	Changed V _(IADP) to V _(IADPT) in IADPT description	7
•	Deleted minimum 10-ms and added minimum to PROCHOT description	
•	Changed 10- Ω to 10-m Ω in I _{DPM_REG_ACC} in Electrical Characteristics	11
•	Changed 10-Ω to 10-mΩ for I _{DPM_REG_ACC_ILIM} in Electrical Characteristics	
•	Changed REG0x07/06 to REG0x0B/0A in V _{DPM_REG_ACC} Test Conditions in Electrical Characteristics	
•	Changed REG0x0B/0A to REG0x07/06 in V _{OTG REG ACC} Test Conditions in Electrical Characteristics	
•	Changed REG0x01[7] = 0 to REG0x01[7] = 1 in Test Conditions for I _{BAT BATFET ON}	12
•	Changed I _{BATOVP} test condition from: on SRP and SRN to: on VSYS pin	
•	Changed Q3 to ACX in CONVERTER OVER-CURRENT COMPARATOR (ACX) in Electrical Characteristics	
•	Added overbar to (BATDRV) in heading	17
•	Added overbar to PROCHOT in Overview	22
•	Changed After CHRG_OK goes HIGH to When CHRG_OK goes LOW in Input Voltage and Current Limit Setup	24
•	Changed Table 1	24
•	Changed 19.5 to 19.5V in 3S row SYSOVP column in Table 1	24
•	Changed 0 to 0 A, lowside to low-side, and LSFET turn-on to LSFET turn-on when the HSFET is off in Continuous Conduction Mode (CCM)	25

Revision History (continued)

•	Changed Pulse Frequency Modulation (PFM)	25
•	Changed during forward mode to during forward supplement mode in High-Accuracy Current Sense Amplifier (IADPT and IBAT)	26
•	Changed REG0x33[5] to REG0x33[5](EN_PKPWR_IDPM) or REG0x33[4](EN_PKPWR_VSYS) in Two-Level Adapter Current Limit (Peak Power Mode)	26
•	Added last sentence to Two-Level Adapter Current Limit (Peak Power Mode)	26
•	Changed Processor Hot Indication	27
•	Changed IADP to IADPT in Figure 13	28
•	Changed bq2570x to bq2570xA in Figure 14	29
•	Added overbar to PROCHOT in PROCHOT Status	
•	Changed subscript of I _{LIM2_VTH} in Input Overcurrent Protection (ACOC)	29
•	Changed bq25700 to bq25703A and 3s - 18.5 V to 3s/4s - 19.5 V in System Overvoltage Protection (SYSOVP)	30
•	Added REG to Battery Charging	30
•	Changed The SMBUS address is 12h (0001001_X), where X is the read/write bit. to The I2C address is D6h (1101101_X), where X is the read/write bit. in Programming	31
•	Added h suffix to addresses in ADDR column in Table 4	34
•	Changed 0 mA – 6350 mA to 50 mA – 6400 mA for 0F/0Eh in Table 4	35
•	Changed Device Address to DeviceID for 2Fh in Table 4	35
•	Changed I2C address from 01h/00h to 01/00h in Figure 23	36
•	Changed bit numbers from 15-8 to 7-0 in Figure 23	36
•	Added <default at="" por=""> to PWM_FREQ description in Table 5</default>	37
•	Added sentence to IBAT_GAIN description in Table 6	37
•	Changed LDO to internal resistor in EN_LDO description in Table 6	37
•	Changed I2C address from 31h/30h to 31/30h in ChargeOption1 Register (I2C address = 31/30h) [reset = 211h]	
•	Changed bit numbers from 15-8 to 7-0 in Figure 24	
•	Deleted Independent Comparator Reference in Table 8	
•	Changed 2.4 V and 1.3 V to 2.3 V and 1.2 V for CMP_REF in Table 8	
•	Deleted Independent Comparator Polarity in Table 8	39
•	Deleted Independent Comparator Deglitch Time in Table 8	
•	Added independent to FORCE_LATCHOFF description in Table 8	
•	Changed I2C address from 33h/32h to 33/32h in ChargeOption2 Register (I2C address = 33/32h) [reset = 2B7]	
•	Changed bit numbers from 15-8 to 7-0 in Figure 25	
•	Changed I2C address from 35h/34h to 35/34h in ChargeOption3 Register (I2C address = 35/34h) [reset = 0h]	
•	Changed bit numbers from 15-8 to 7-0 in Figure 26	
•	Added <default at="" por=""> to BATFETOFF_ HIZ description in Table 12</default>	
•	Added <default at="" por=""> to PSYS_OTG_ IDCHG description in Table 12</default>	
•	Changed I2C address from 37h/36h to 37/36h in ChargeOption3 Register (I2C address = 35/34h) [reset = 0h]	
•	Changed bit numbers from 15-11 to 7-3, 10-9 to 2-1, 8 to 0 in Figure 27	
•	Added PROCHOT Pulse Extension Enable to EN_PROCHOT_EXT description in Table 14	
•	Changed I2C address from 39h/38h to 39/38h in ProchotOption1 Register (I2C address = 39/38h) [reset = 8120h]	
•	Changed bit numbers from 15-10 to 7-2, 9-8 to 1-0 in Figure 28	
•	Added There is a 128 mA offset. to IDCHG_VTH description in Table 15	
•	Changed 0 mA to 000000b in IDCHG_VTH description in Table 15	
•	Changed PROCHOT_PROFILE_ACOK description in Table 16	
•	Changed bit numbers from 15 to 7, 14 to 6, 13 to 5 and 12-8 to 4-0 in Figure 29	
•	Changed bit numbers from 15-8 to 7-0 in Figure 30	49

Revision History (continued)

•	Changed bit numbers from 15-8 to 7-0 in Figure 31	51
•	Changed text in ChargeCurrent Register (I2C address = 03/02h) [reset = 0h]	52
•	Changed bit numbers from 15-8 to 7-0 in Figure 32	52
•	Deleted Upon POR or when charge is disabled, the system is regulated at the MaxChargeVoltage register. from	
	MaxChargeVoltage Register (I2C address = 05/04h) [reset value based on CELL_BATPRESZ pin setting]	54
•	Changed bit numbers from 15-8 to 7-0 in Figure 33	
•	Changed bit numbers from 15-8 to 7-0 in Figure 34	56
•	Deleted text and changed larger to 20-mΩ in Input Current Registers	57
•	Added paragraph to IIN_HOST Register With 10-m Ω Sense Resistor (I2C address = 0F/0Eh) [reset = 4000h]	58
•	Changed bit numbers from 15-8 to 7-0 in Figure 35	58
•	Changed bit numbers from 15-8 to 7-0 in Figure 36	59
•	Changed bit numbers from 15-8 to 7-0 in Figure 37	60
•	Changed bit numbers from 15-8 to 7-0 in Figure 38	61
•	Changed bit numbers from 15-8 to 7-0 in Figure 39	62
•	Changed I2C address to 27/26h in ADCVBUS/PSYS Register (I2C address = 27/26h)	63
•	Changed bit numbers from 15-8 to 7-0 in Figure 40	63
•	Changed ADCVBUS/PSYS Register Field Descriptions into two tables	63
•	Changed I2C address to 29/28h in ADCIBAT Register (I2C address = 29/28h)	64
•	Changed bit numbers from 15-8 to 7-0 in Figure 41	
•	Changed ADCIBAT Register Field Descriptions into two tables	64
•	Changed I2C address to 2B/2Ah in ADCIINCMPIN Register (I2C address = 2B/2Ah)	65
•	Changed bit numbers from 15-8 to 7-0 in Figure 42	
•	Changed ADCIINCMPIN Register Field Descriptions into two tables	
•	Changed I2C address to 2D/2Ch in ADCVSYSVBAT Register (I2C address = 2D/2Ch)	
•	Changed bit numbers from 15-8 to 7-0 in Figure 43	
•	Changed ADCVSYSVBAT Register Field Descriptions into two tables	
•	Changed bit numbers from 15-8 to 7-0 in Figure 44	
•	Deleted 15-8, Reserved, and R from Figure 45	
•	Deleted 15-8, Reserved, and R from Table 48	
•	Changed Figure 46	
	Changed Minimum System Voltage from 614 mV to 6144 mV in Design Requirements	
	Deleted Input Snubber and Filter for Voltage Spike Damping section	
	Changed Figure 47	
	Added Bulk input capacitors should be locate in front of input current sensing resistor. Do not recommend to put	. 00
	bulk input capacitors between input sensing resistor and switching MOSFET. to Input Capacitor	70
•	Changed Minimum 4 - 6 pcs of 10-µF 0805 size capacitor is suggested for 45 - 65 W adapter design. to Minimum 10-µF effective capacitance (7 pcs of 10-µF 0805 size capacitor) is suggested for 45 W-65 W adapter. in Input	
	Capacitor	. 70
•	Changed Minimum 6 pcs of 10-μF 0805 size capacitor is suggested to be placed by the inductor. to Minimum 10-μF effective capacitance (7 pcs of 10-μF 0805 size capacitor) is suggested to be placed by the inductor, and 50-μF effective distributed capacitance on Vsvs output, in Output Capacitor	70

5 Description (continued)

During power up, the charger sets converter to buck, boost or buck-boost configuration based on input source and battery conditions. The charger automatically transits among buck, boost and buck-boost configuration without host control.

In the absence of an input source, the bq25703A supports On-the-Go (OTG) function from 1- to 4-cell battery to generate 4.48 V to 20.8 V on VBUS. During OTG mode, the charger regulates output voltage and output current.

The bq25703A monitors adapter current, battery current and system power. The flexibly programmed PROCHOT output goes directly to CPU for throttle back when needed.

6 Pin Configuration and Functions

Pin Functions

PIN			DECODINE	
NAME	NUMBER	1/0	DESCRIPTION	
ACN	2	PWR	Input current sense resistor negative input. The leakage on ACP and ACN are matched. The series resistors on the ACP and ACN pins are placed between sense resistor and filter cap. Refer to <i>Application and Implementation</i> for ACP/ACN filter design.	
ACP	3	PWR	nput current sense resistor positive input. The leakage on ACP and ACN are matched. The leries resistors on the ACP and ACN pins are placed between sense resistor and filter cap. Refer to Application and Implementation for ACP/ACN filter design.	
BATDRV	21	0	P-channel battery FET (BATFET) gate driver output. It is shorted to VSYS to turn off the BATFET. It goes 10 V below VSYS to fully turn on BATFET. BATFET is in linear mode to regulate VSYS at minimum system voltage when battery is depleted. BATFET is fully on during fast charge and supplement mode.	
BTST1	30	PWR	Buck mode high side power MOSFET driver power supply. Connect a 0.047-µF capacitor between SW1 and BTST1. The bootstrap diode between REGN and BTST1 is integrated.	
BTST2	25	PWR	Boost mode high side power MOSFET driver power supply. Connect a 0.047-μF capacitor between SW2 and BTST2. The bootstrap diode between REGN and BTST2 is integrated.	
CELL_BATPRESZ	18	I	Battery cell selection pin for 1–4 cell battery setting. CELL_BATPRESZ pin is biased from VDDA. CELL_BATPRESZ pin also sets SYSOVP threshold to 5 V for 1-cell, 12 V for 2-cell, and 19.5 V for 3-cell/4-cell. CELL_BATPRESZ pin is pulled below V _{CELL_BATPRESZ_FALL} to indicate battery removal. The device exits LEARN mode, and disables charge. REG0x05/04() goes back to default.	

Pin Functions (continued)

PIN PIN				
NAME	NUMBER	I/O	DESCRIPTION	
CHRG_OK	4	0	Open drain active high indicator to inform the system good power source is connected to the charger input. Connect to the pullup rail via $10\text{-}k\Omega$ resistor. When VBUS rises above 3.5V or falls below 24.5V, CHRG_OK is HIGH after 50ms deglitch time. When VBUS is falls below 3.2 V or rises above 26 V, CHRG_OK is LOW. When fault occurs, CHRG_OK is asserted LOW.	
CMPIN	14	l	Input of independent comparator. The independent comparator compares the voltage sensed on CMPIN pin to internal reference, and its output is on CMPOUT pin. Internal reference, output polarity and deglitch time is selectable by I2C. With polarity HIGH (REG0x30[6] = 1), place a resistor between CMPIN and CMPOUT to program hysteresis. With polarity LOW (REG0x30[6] = 0), the internal hysteresis is 100 mV. If the independent comparator is not in use, tie CMPIN to ground.	
CMPOUT	15	0	Open-drain output of independent comparator. Place pullup resistor from CMPOUT to pullup supply rail. Internal reference, output polarity and deglitch time are selectable by I2C.	
COMP2	17	I	Buck boost converter compensation pin 2. Refer to bq25700 EVM schematic for COMP2 pin RC network.	
COMP1	16	Ι	Buck boost converter compensation pin 1. Refer to bq25700 EVM schematic for COMP1 pin RC network.	
EN_OTG	5	1	Active HIGH to enable OTG mode. When EN_OTG pin is HIGH and REG0x35[4] is HIGH, OTG can be enabled, refer to <i>USB On-The-Go (OTG)</i> for details of how to enable OTG function	
HIDRV1	31	0	Buck mode high side power MOSFET (Q1) driver. Connect to high side n-channel MOSFET gate.	
HIDRV2	24	0	Boost mode high side power MOSFET(Q4) driver. Connect to high side n-channel MOSFET gate.	
IADPT	8	I/O	Buffered adapter current output. $V_{(IADPT)}=20$ or $40 \times (V_{(ACP)}-V_{(ACN)})$. With ratio selectable in REG0x00[4]. Place a resistor from the IADPT pin to ground corresponding to inductor in use. For 2.2 μ H, the resistor is 137 k Ω . Place 100-pF or less ceramic decoupling capacitor from IADPT pin to ground. IADPT output voltage is clamped below 3.3 V.	
IBAT	9	0	Buffered battery current selected by I2C. $V_{(IBAT)} = 8$ or $16 \times (V_{(SRP)} - V_{(SRN)})$ for charge current, or $V_{(IBAT)} = 8$ or $16 \times (V_{(SRN)} - V_{(SRP)})$ for discharge current, with ratio selectable in REG0x00[3]. Place 100-pF or less ceramic decoupling capacitor from IBAT pin to ground. This pin can be floating if not in use. Its output voltage is clamped below 3.3 V.	
ILIM_HIZ	6	I	Input current limit input. Program ILIM_HIZ voltage by connecting a resistor divider from supply rail to ILIM_HIZ pin to ground. The pin voltage is calculated as: V _(ILIM_HIZ) = 1 V + 40 × IDPM × RAC, in which IDPM is the target input current. The input current limit used by the charger is the lower setting of ILIM_HIZ pin and REG0x0F() and REG0x0E(). When the pin voltage is below 0.4 V, the device enters Hi-Z mode with low quiescent current. When the pin voltage is above 0.8 V, the device is out of Hi-Z mode.	
LODRV1	29	0	Buck mode low side power MOSFET (Q2) driver. Connect to low side n-channel MOSFET gate.	
LODRV2	26	0	Boost mode low side power MOSFET (Q3) driver. Connect to low side n-channel MOSFET gate.	
PGND	27	GND	Device power ground.	
PROCHOT	11	0	Active low open drain output of processor hot indicator. It monitors adapter input current, battery discharge current, and system voltage. After any event in the PROCHOT profile is triggered, a pulse is asserted. The minimum pulse width is adjustable in REG0x36[5:2].	
PSYS	10	0	Current mode system power monitor. The output current is proportional to the total power from the adapter and battery. The gain is selectable through I2C. Place a resistor from PSYS to ground to generate output voltage. This pin can be floating if not in use. Its output voltage is clamped below 3.3 V. Place a capacitor in parallel with the resistor for filtering.	
REGN	28	PWR	6-V linear regulator output supplied from VBUS or VSYS. The LDO is active when VBUS above V_{VBUS_CONVEN} . Connect a 2.2- or 3.3- μ F ceramic capacitor from REGN to power ground. REGN pin output is for power stage gate drive.	
SCL	13	I	I2C clock input. Connect to clock line from the host controller or smart battery. Connect a 10-k Ω pullup resistor according to I2C specifications.	
SDA	12	I/O	I2C open-drain data I/O. Connect to data line from the host controller or smart battery. Connect a 10 -k Ω pullup resistor according to I2C specifications.	

Pin Functions (continued)

PIN		1/0	DESCRIPTION		
NAME	NUMBER	1/0	DESCRIPTION		
SRN	19	PWR	Charge current sense resistor negative input. SRN pin is for battery voltage sensing as well. Connect SRN pin with optional 0.1- μ F ceramic capacitor to GND for common-mode filtering. Connect a 0.1- μ F ceramic capacitor from SRP to SRN to provide differential mode filtering. The leakage current on SRP and SRN are matched. For reverse battery plug-in protection, $10-\Omega$ series resistors are placed on SRP and SRN.		
SRP	20	PWR	Charge current sense resistor positive input. Connect 0.1 - μ F ceramic capacitor from SRP to SRN to provide differential mode filtering. The leakage current on SRP and SRN are natched. For reverse battery plug-in protection, 10 - Ω series resistors are placed on SRP and SRN. Connect SRP pin with optional 0.1 - μ F ceramic capacitor to GND for common-mode iltering.		
SW1	32	PWR	Buck mode high side power MOSFET driver source. Connect to the source of the high side n-channel MOSFET.		
SW2	23	PWR	Boost mode high side power MOSFET driver source. Connect to the source of the high side n-channel MOSFET.		
VBUS	1	PWR	Charger input voltage. An input low pass filter of 1Ω and 0.47 μF (minimum) is recommended.		
VDDA	7	PWR	Internal reference bias pin. Connect a 10- Ω resistor from REGN to VDDA and a 1- μ F ceramic capacitor from VDDA to power ground.		
VSYS	22	PWR	Charger system voltage sensing. The system voltage regulation limit is programmed in REG0x05/04() and REG0X0D/0C().		
Thermal pad	_	-	Exposed pad beneath the IC. Analog ground and power ground star-connected near the IC's ground. Always solder thermal pad to the board, and have vias on the thermal pad plane connecting to power ground planes. It also serves as a thermal pad to dissipate the heat.		

7 Specifications

7.1 Absolute Maximum Ratings

Storage temperature, T _{stq}		-40	155	°C

⁽¹⁾ Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

7.2 ESD Ratings

			VALUE	UNIT
\/	Floatroototic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000	\/
V _(ESD)	Electrostatic discharge	Charged-device model (CDM), per JEDEC specification JESD22-C101 (2)	±500	V

⁽¹⁾ JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT
	ACN, ACP, VBUS	0	24	
	SRN, SRP, VSYS, BATDRV	0	19.2	
	SW1, SW2	-2	24	
Voltage	BTST1, BTST2, HIDRV1, HIDRV2	0	30	V
voltage	SDA, SCL, REGN, CHRG_OK, CELL_BATPRESZ, ILIM_HIZ, LODRV1, LODRV2, VDDA, COMP1, COMP2, CMPIN, CMPOUT	0	6.5	·
	PROCHOT	0	5.3	
	IADPT, IBAT, PSYS	0	3.3	
Differential	BTST1-SW1, BTST2-SW2, HIDRV1-SW1, HIDRV2-SW2	0	6.5	V
voltage	SRP-SRN, ACP-ACN	-0.35	0.35	V
Junction temp	perature, T _J	-40	125	°C
Operating free	e-air temperature, T _A	-40	85	°C

⁽²⁾ All voltages are with respect to GND if not specified. Currents are positive into, negative out of the specified terminal. Consult Packaging Section of the data book for thermal limitations and considerations of packages.

⁽²⁾ JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.4 Thermal Information

		bq25703A	
	THERMAL METRIC ⁽¹⁾	RSN (WQFN)	UNIT
		32 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	37.2	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	26.1	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	7.8	°C/W
ΨЈТ	Junction-to-top characterization parameter	0.3	°C/W
ΨЈВ	Junction-to-board characterization parameter	7.8	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	2.3	°C/W

⁽¹⁾ For more information about traditional and new thermal metrics, see the Semiconductor and IC Package Thermal Metrics application report.

7.7 Typical Characteristics

TEXAS INSTRUMENTS

Typical Characteristics (continued)

Typical Characteristics (continued)

8 Detailed Description

8.1 Overview

The bq25703A is a buck boost NVDC (narrow voltage DC) charge controller for multi-chemistry portable applications such as notebook, detachable, ultrabook, tablet and other mobile devices with rechargeable batteries. It provides seamless transition between converter operation modes (buck, boost, or buck boost), fast transient response, and high light load efficiency.

The bq25703A supports wide range of power sources, including USB PD ports, legacy USB ports, traditional AC-DC adapters, etc. It takes input voltage from 3.5 V to 24 V, and charges battery of 1-4 series. It also supports USB On-The-Go (OTG) to provide 4.48V to 20.8V output at USB port.

The bq25703A features Dynamic Power Management (DPM) to limit the input power and avoid AC adapter overloading. During battery charging, as the system power increases, the charging current will reduce to maintain total input current below adapter rating. If system power demand temporarily exceeds adapter rating, the bq25703A supports NVDC architecture to allow battery discharge energy to supplement system power. For details, refer to *System Voltage Regulation* section.

In order to be compliant with an Intel IMVP8 compliant system, the bq25703A includes PSYS function to monitor the total platform power from adapter and battery. Besides PSYS, it provides both an independent input current buffer (IADPT) and a battery current buffer (IBAT) with highly accurate current sense amplifiers. If the platform power exceeds the available power from adapter and battery, a PROCHOT signal is asserted to CPU so that the CPU optimizes its performance to the power available to the system.

The I2C controls input current, charge current and charge voltage registers with high resolution, high accuracy regulation limits. It also sets the PROCHOT timing and threshold profile to meet system requirements.

8.3 Feature Description

8.3.1 Power-Up from Battery Without DC Source

If only battery is present and the voltage is above V_{VBAT_UVLOZ} , the BATFET turns on and connects battery to system. By default, the charger is in low power mode (REG0x01[7] = 1) with lowest quiescent current. The LDO stays off. When device moves to performance mode (REG0x01[7] = 0), The host enables IBAT buffer through I2C to monitor discharge current. For PSYS, PROCHOT or independent comparator, REGN LDO is enabled for an accurate reference.

8.3.2 Power-Up From DC Source

When an input source plugs in, the charger checks the input source voltage to turn on LDO and all the bias circuits. It sets the input current limit before the converter starts.

The power-up sequence from DC source is as follows:

- 1. 50 ms after VBUS above V_{VBUS CONVEN}, enable 6 V LDO and CHRG_OK goes HIGH
- 2. Input voltage and current limit setup
- 3. Battery CELL configuration
- 4. 150 ms after VBUS above $V_{VBUS\ CONVEN}$, converter powers up.

8.3.2.1 CHRG OK Indicator

CHRG_OK is an active HIGH open drain indicator. It indicates the charger is in normal operation when the following conditions are valid:

- VBUS is above V_{VBUS_CONVEN}
- VBUS is below V_{ACOV}
- No MOSFET/inductor, or over-voltage, over-current, thermal shutdown fault

8.3.2.2 Input Voltage and Current Limit Setup

When CHRG_OK goes LOW, the charger sets default input current limit in REG0x0F/0E() to 3.30 A. The actual input current limit is the lower setting of REG0x0F/0E() and ILIM_HIZ pin.

Charger initiates a VBUS voltage measurement without any load (VBUS at no load). The default VINDPM threshold is VBUS at no load – 1.28 V.

After input current and voltage limits are set, the charger device is ready to power up. The host can always update input current and voltage limit based on input source type.

8.3.2.3 Battery Cell Configuration

CELL_BATPRESZ pin is biased with resistors from REGN to CELL_BATPRESZ to GND. After VDDA LDO is activated, the device detects the battery configuration through CELL_BATPRESZ pin bias voltage. Refer to *Electrical Characteristics* for CELL setting thresholds.

Table 1. Battery Cell Configuration

CELL COUNT	PIN VOLTAGE w.r.t. VDDA	BATTERY VOLTAGE (REG0x15)	SYSOVP
48	75%	16.800V	19.5V
3S	55%	12.592V	19.5V
2S	40%	8.400V	12V
1S	25%	4.192V	5V

8.3.2.4 Device Hi-Z State

The charger enters Hi-Z mode when ILIM_HIZ pin voltage is below 0.4 V or REG0x35[7] is set to 1. During Hi-Z mode, the input source is present, and the charger is in the low quiescent current mode with REGN LDO enabled.

8.3.3 USB On-The-Go (OTG)

The device supports USB OTG operation to deliver power from the battery to other portable devices through USB port. The OTG mode output voltage is set in REG0x07/06(). The OTG mode output current is set in REG0x09/08(). The OTG operation can be enabled if the conditions are valid:

- Valid battery voltage is set REG0x05/04()
- OTG output voltage is set in REG0x07/06() and output current is set in REG0x09/08()
- EN OTG pin is HIGH and REG0x35[4] = 1
- VBUS is below V_{VBUS UVLO}
- 10 ms after the above conditions are valid, converter starts and VBUS ramps up to target voltage. CHRG_OK pin goes HIGH if REG0x01[3] = 1.

8.3.4 Converter Operation

The charger employs a synchronous buck-boost converter that allows charging from a standard 5-V or a high-voltage power source. The charger operates in buck, buck-boost and boost mode. The buck-boost can operate uninterruptedly and continuously across the three operation modes.

MODE **BUCK BUCK-BOOST BOOST** Q1 Switching Switching ON Q2 OFF Switching Switching Q3 OFF Switching Switching Q4 ON Switching Switching

Table 2. MOSFET Operation

8.3.4.1 Inductor Setting through IADPT Pin

The charger reads the inductor value through the IADPT pin.

Table 3. Inductor Setting on IADPT Pin

INDUCTOR IN USE	RESISTOR ON IADPT PIN
1 μΗ	93 kΩ
2.2 µH	137 kΩ
3.3 µH	169 kΩ

8.3.4.2 Continuous Conduction Mode (CCM)

With sufficient charge current, the inductor current does not cross 0 A, which is defined as CCM. The controller starts a new cycle with ramp coming up from 200 mV. As long as error amplifier output voltage is above the ramp voltage, the high-side MOSFET (HSFET) stays on. When the ramp voltage exceeds error amplifier output voltage, HSFET turns off and low-side MOSFET (LSFET) turns on. At the end of the cycle, ramp gets reset and LSFET turns off, ready for the next cycle. There is always break-before-make logic during transition to prevent cross-conduction and shoot-through. During the dead time when both MOSFETs are off, the body-diode of the low-side power MOSFET conducts the inductor current.

During CCM, the inductor current always flows and creates a fixed two-pole system. Having the LSFET turn-on when the HSFET is off keeps the power dissipation low and allows safe charging at high currents.

8.3.4.3 Pulse Frequency Modulation (PFM)

In order to improve converter light-load efficiency, the bq25703A switches to PFM control at light load. The effective switching frequency will decrease accordingly when system load decreases. The minimum frequency can be limit to 25 kHz (ChargeOption0() bit[10]=1).

8.3.5 Current and Power Monitor

8.3.5.1 High-Accuracy Current Sense Amplifier (IADPT and IBAT)

As an industry standard, a high-accuracy current sense amplifier (CSA) is used to monitor the input current during forward charging, or output current during OTG (IADPT) and the charge/discharge current (IBAT). IADPT voltage is 20x or 40x the differential voltage across ACP and ACN. IBAT voltage is 8x/16x (during charging), or 8x/16x (during discharging) of the differential across SRP and SRN. After input voltage or battery voltage is above UVLO, IADPT output becomes valid. To lower the voltage on current monitoring, a resistor divider from CSA output to GND can be used and accuracy over temperature can still be achieved.

- V_(IADPT) = 20 or 40 x (V_(ACP) V_(ACN)) during forward mode, or 20 or 40 x (V_(ACN) V_(ACP)) during reverse OTG mode.
- $V_{(IBAT)} = 8 \text{ or } 16 \times (V_{(SRP)} V_{(SRN)}) \text{ during forward mode.}$
- V_(IBAT) = 8 or 16 × (V_(SRN) V_(SRP)) during forward supplement mode, or reverse OTG mode.

A maximum 100-pF capacitor is recommended to connect on the output for decoupling high-frequency noise. An additional RC filter is optional, if additional filtering is desired. Note that adding filtering also adds additional response delay. The CSA output voltage is clamped at 3.3 V.

8.3.5.2 High-Accuracy Power Sense Amplifier (PSYS)

The charger monitors total system power. During forward mode, the input adapter powers system. During reverse OTG mode, the battery powers the system and VBUS output. The ratio of PSYS current and total power K_{PSYS} can be programmed in REG0x31[1] with default 1 μ A/W. The input and charge sense resistors (RAC and RSR) are programmed in REG0x31[3:2]. PSYS voltage can be calculated with Equation 1 where IIN>0 when adapter is in forward charging, and IBAT>0 when the battery is in discharge when the battery is in discharge.

$$V_{PSYS} = R_{PSYS} \times K_{PSYS} (V_{ACP} \times I_{IN} + V_{BAT} \times I_{BAT})$$
(1)

For proper PSYS functionality, RAC and RSR values are limited to 10 m Ω and 20 m Ω .

8.3.6 Input Source Dynamic Power Manage

Refer to Input Current and Input Voltage Registers for Dynamic Power Management.

8.3.7 Two-Level Adapter Current Limit (Peak Power Mode)

Usually adapter can supply current higher than DC rating for a few milliseconds to tens of milliseconds. The charger employs two-level input current limit, or peak power mode, to fully utilize the overloading capability and minimize battery discharge during CPU turbo mode. Peak power mode is enabled in REG0x33[5](EN_PKPWR_IDPM) or REG0x33[4](EN_PKPWR_VSYS). The DC current limit, or I_{LIM1} , is the same as adapter DC current, set in REG0x0F/0E(). The overloading current, or I_{LIM2} , is set in REG0x37[7:3], as a percentage of I_{LIM1}

When the charger detects input current surge and battery discharge due to load transient, it applies I_{LIM2} for T_{OVLD} in REG0x33[7:6], first, and then I_{LIM1} for up to $T_{MAX} - T_{OVLD}$ time. T_{MAX} is programmed in REG0x33[1:0]. After T_{MAX} , if the load is still high, another peak power cycle starts. Charging is disabled during T_{MAX} , once T_{MAX} , expires, charging continues. If T_{OVLD} is programmed higher than T_{MAX} , then peak power mode is always on.

Figure 12. Two-Level Adapter Current Limit Timing Diagram

8.3.8 Processor Hot Indication

When CPU is running turbo mode, the system peak power may exceed available power from adapter and battery together. The adapter current and battery discharge peak current, or system voltage drop is indication that system power is too high. The charger processor hot function monitors these events, and PROCHOT pulse is asserted. Once CPU receives PROCHOT pulse from charger, it slows down to reduce system power. The processor hot function monitors these events, and PROCHOT pulse is asserted.

The PROCHOT triggering events include:

- ICRIT: adapter peak current, as 110% of I_{LIM2}
- INOM: adapter average current (110% of input current limit)
- IDCHG: battery discharge current
- VSYS: system voltage on VSYS
- Adapter Removal: upon adapter removal (CHRG OK pin HIGH to LOW)
- Battery Removal: upon battery removal (CELL_BATPRESZ pin goes LOW)
- CMPOUT: Independent comparator output (CMPOUT pin HIGH to LOW)

The threshold of ICRIT, IDCHG or VSYS, and the deglitch time of ICRIT, INOM, IDCHG or CMPOUT are programmable through I2C. Each triggering event can be individually enabled in REG0x38[6:0]. When any event in PROCHOT profile is triggered, PROCHOT is asserted low for minimum 10 ms programmable in 0x36[4:3]. At the end of the 10 ms, if the PROCHOT event is still active, the pulse gets extended.

Copyright © 2017, Texas Instruments Incorporated

Figure 13. PROCHOT Profile

8.3.8.1 PROCHOT During Low Power Mode

<u>During low</u> power mode (REG0x01[7] = 1), the charger offers a low quiescent current (\sim 150 μ A). Low power PROCHOT <u>function uses</u> the independent comparator to monitor battery discharge current and system voltage, and assert <u>PROCHOT</u> to CPU.

Below lists the register setting to enable PROCHOT during low power mode.

- REG0x01[7] = 1
- REG0x38[5:0] = 000000
- REG0x30[6:4] = 100
- Independent comparator threshold is always 1.2 V
- When REG0x31[6] = 1, charger monitors discharge current. Connect CMPIN to voltage proportional to IBAT pin. PROCHOT triggers from HIGH to LOW when CMPIN voltage falls below 1.2 V.
- When REG0x31[5] = 1, charger monitors system voltage. Connect CMPIN to voltage proportional to system. PROCHOT triggers from HIGH to LOW when CMPIN voltage rises above 1.2 V.

Copyright © 2017, Texas Instruments Incorporated

Figure 14. PROCHOT Low Power Mode Implementation

8.3.8.2 PROCHOT Status

REG0x22[6:0] reports which event in the profile triggers $\overline{PROCHOT}$ by setting the corresponding bit to 1. The status bit can be reset back to 0 after it is read by host, and current $\overline{PROCHOT}$ event is no longer active.

Assume there are two PROCHOT events, event A and event B. Event A triggers PROCHOT first, but event B is also active. Both status bits will be HIGH. At the end of the 10 ms PROCHOT pulse, if PROCHOT is still active (either by A or B), the PROCHOT pulse is extended.

8.3.9 Device Protection

8.3.9.1 Watchdog Timer

The charger includes watchdog timer to terminate charging if the charger does not receive a write MaxChargeVoltage() or write ChargeCurrent() command within 175 s (adjustable via REG0x01[6:5]). When watchdog timeout occurs, all register values are kept unchanged except ChargeCurrent() resets to zero. Battery charging is suspended. Write MaxChargeVoltage() or write ChargeCurrent() commands must be re-sent to reset watchdog timer and resume charging. Writing REG0x01[6:5] = 00 to disable watchdog timer also resumes charging.

8.3.9.2 Input Overvoltage Protection (ACOV)

The charger has fixed ACOV voltage. When VBUS pin voltage is higher than ACOV, it is considered as adapter over voltage. CHRG_OK will be pulled low, and converter will be disabled. As system falls below battery voltage, BATFET will be turned on. When VBUS pin voltage falls below ACOV, it is considered as adapter voltage returns back to normal voltage. CHRG_OK is pulled high by external pull up resistor. The converter resumes if enable conditions are valid.

8.3.9.3 Input Overcurrent Protection (ACOC)

If the input current exceeds the 1.25x or 2x (REG0x32[2]) of I_{LIM2_VTH} (REG0x37[7:3]) set point, converter stops switching. After 300 ms, converter starts switching again.

8.3.9.4 System Overvoltage Protection (SYSOVP)

When the converter starts up, the bq25703A reads CELL pin configuration and sets MaxChargeVoltage() and SYSOVP threshold (1s - 5 V, 2s - 12 V, 3s/4s - 19.5 V). Before REGx05/04() is written by the host, the battery configuration will change with CELL pin voltage. When SYSOVP happens, the device latches off the converter. REG20[4] is set as 1. The user can clear latch-off by either writing 0 to the SYSOVP bit or removing and plugging in the adapter again. After latch-off is cleared, the converter starts again.

8.3.9.5 Battery Overvoltage Protection (BATOVP)

Battery over-voltage may happen when battery is removed during charging or the user plugs in a wrong battery. The BATOVP threshold is 104% (1 s) or 102% (2 s to 4 s) of regulation voltage set in REG0x05/04().

8.3.9.6 Battery Short

If BAT voltage falls below SYSMIN during charging, the maximum current is limited to 384 mA.

8.3.9.7 Thermal Shutdown (TSHUT)

The WQFN package has low thermal impedance, which provides good thermal conduction from the silicon to the ambient, to keep junction temperatures low. As added level of protection, the charger converter turns off for self-protection whenever the junction temperature exceeds the 155°C. The charger stays off until the junction temperature falls below 135°C. During thermal shut down, the LDO current limit is reduced to 16 mA and REGN LDO stays off. When the temperature falls below 135°C, charge can be resumed with soft start.

8.4 Device Functional Modes

8.4.1 Forward Mode

When input source is connected to VBUS, bq25703A is in forward mode to regulate system and charge battery.

8.4.1.1 System Voltage Regulation with Narrow VDC Architecture

The bq25703A employs Narrow VDC architecture (NVDC) with BATFET separating system from battery. The minimum system voltage is set by MinSystemVoltage(). Even with a deeply depleted battery, the system is regulated above the minimum system voltage.

When the battery is below minimum system voltage setting, the BATFET operates in linear mode (LDO mode).

As the battery voltage rises above the minimum system voltage, BATFET is fully on when charging or in supplement mode and the voltage difference between the system and battery is the VDS of BATFET. System voltage is regulated 160 mV above battery voltage when BATFET is off (no charging or no supplement current).

See System Voltage Regulation for details on system voltage regulation and register programming.

8.4.1.2 Battery Charging

The bq25703A charges 1-4 cell battery in constant current (CC), and constant voltage (CV) mode. Based on CELL_BATPREZ pin setting, the charger sets default battery voltage 4.2V/cell to ChargeVoltage(), or REG0x05/04(). According to battery capacity, the host programs appropriate charge current to ChargeCurrent(), or REG0x03/02(). When battery is full or battery is not in good condition to charge, host terminates charge by setting REG0x00[0] to 1, or setting ChargeCurrent() to zero.

See *Feature Description* for details on register programming.

8.4.2 USB On-The-Go

The bq25703A supports USB OTG functionality to deliver power from the battery to other portable devices through USB port (reverse mode). The OTG output voltage is compliant with USB PD specification, including 5 V, 9 V, 15 V, and 20 V (REG0x07/06()). The output current regulation is compliant with USB type C specification, including 500 mA, 1.5 A, 3 A and 5 A (REG0x09/08()).

Similar to forward operation, the device switches from PWM operation to PFM operation at light load to improve efficiency.

8.5 Programming

The charger supports battery-charger commands that use either Write-Word or Read-Word protocols, as summarized in *Table 4*. The I2C address is D6h (1101101_X), where X is the read/write bit. The ManufacturerID and DeviceID registers are assigned identify the charger device. The ManufacturerID register command always returns 40h.

8.5.1 I²C Serial Interface

The bq25703A uses I2C compatible interface for flexible charging parameter programming and instantaneous device status reporting. I²C is a bi-directional 2-wire serial interface. Only two bus lines are required: a serial data line (SDA) and a serial clock line (SCL). Devices can be considered as masters or slaves when performing data transfers. A master is the device which initiates a data transfer on the bus and generates the clock signals to permit that transfer. At that time, any device addressed is considered a slave.

The device operates as a slave device with address D6h, receiving control inputs from the master device like micro controller or a digital signal processor through REG00-REG0F. The I²C interface supports both standard mode (up to 100 kbits), and fast mode (up to 400 kbits). connecting to the positive supply voltage via a current source or pull-up resistor. When the bus is free, both lines are HIGH. The SDA and SCL pins are open drain.

8.5.1.1 Data Validity

The data on the SDA line must be stable during the HIGH period of the clock. The HIGH or LOW state of the data line can only change when the clock signal on the SCL line is LOW. One clock pulse is generated for each data bit transferred.

Figure 15. Bit Transfer on the I²C Bus

8.5.1.2 START and STOP Conditions

All transactions begin with a START (S) and can be terminated by a STOP (P). A HIGH to LOW transition on the SDA line while SCI is HIGH defines a START condition. A LOW to HIGH transition on the SDA line when the SCL is HIGH defines a STOP condition.

START and STOP conditions are always generated by the master. The bus is considered busy after the START condition, and free after the STOP condition.

Figure 16. START and STOP Conditions

Programming (continued)

8.5.1.3 Byte Format

Every byte on the SDA line must be 8 bits long. The number of bytes to be transmitted per transfer is unrestricted. Each byte has to be followed by an Acknowledge bit. Data is transferred with the Most Significant Bit (MSB) first. If a slave cannot receive or transmit another complete byte of data until it has performed some other function, it can hold the clock line SCL low to force the master into a wait state (clock stretching). Data transfer then continues when the slave is ready for another byte of data and release the clock line SCL.

Figure 17. Data Transfer on the I²C Bus

8.5.1.4 Acknowledge (ACK) and Not Acknowledge (NACK)

The acknowledge takes place after every byte. The acknowledge bit allows the receiver to signal the transmitter that the byte was successfully received and another byte may be sent. All clock pulses, including the acknowledge 9th clock pulse, are generated by the master.

The transmitter releases the SDA line during the acknowledge clock pulse so the receiver can pull the SDA line LOW and it remains stable LOW during the HIGH period of this clock pulse.

When SDA remains HIGH during the 9th clock pulse, this is the Not Acknowledge signal. The master can then generate either a STOP to abort the transfer or a repeated START to start a new transfer.

Programming (continued)

8.5.1.5 Slave Address and Data Direction Bit

After the START, a slave address is sent. This address is 7 bits long followed by the eighth bit as a data direction bit (bit R/W). A zero indicates a transmission (WRITE) and a one indicates a request for data (READ).

Figure 18. Complete Data Transfer

8.5.1.6 Single Read and Write

Figure 19. Single Write

Figure 20. Single Read

If the register address is not defined, the charger IC send back NACK and go back to the idle state.

8.5.1.7 Multi-Read and Multi-Write

The charger device supports multi-read and multi-write.

Figure 21. Multi Write

Programming (continued)

Figure 22. Multi Read

8.5.1.8 Write 2-Byte I2C Commands

A few I2C commands combine two 8-bit registers together to form a complete value. These commands include:

- ChargeCurrent()
- MaxChargeVoltage()
- IIN_DPM()
- OTGVoltage()
- InputVoltage()

Host has to write LSB command followed by MSB command. No other command can be inserted in between these two writes. The charger waits for the complete write to the two registers to decide whether to accept or ignore the new value.

After the completion of LSB and MSB bytes, the two bytes will be updated at the same time. If host writes MSB byte first, the command will be ignored. If the time between write of LSB and MSB bytes exceeds watchdog timer, both the LSB and MSB commands will be ignored.

100				· .
12C 01h	FIELD	TYPE	RESET	DESCRIPTION
7	EN_LWPWR	R/W	1b	Low Power Mode Enable
				0b: Disable Low Power Mode. Device in performance mode with battery only. The PROCHOT, current/power monitor buffer and comparator follow register setting.
				1b: Enable Low Power Mode. Device in low power mode with battery only for lowest quiescent current. PROCHOT, discharge current monitor buffer, power monitor buffer and independent comparator are disabled. ADC is not available in Low Power Mode.Independent comparator can be enabled by setting either REG0X31()[6] or [5] to 1. <default at="" por=""></default>
6-5	WDTMR_ADJ	R/W	11b	WATCHDOG Timer Adjust
				Set maximum delay between consecutive I2C write of charge voltage or charge current command.
				If device does not receive a write on the REG0x05/04() or the REG0x03/02() within the watchdog time period, the charger will be suspended by setting the REG0x03/02() to 0 mA.
				After expiration, the timer will resume upon the write of REG0x03/02(), REG0x05/04() or REG0x01[6:5]. The charger will resume if the values are valid.
				00b: Disable Watchdog Timer
				01b: Enabled, 5 sec
				10b: Enabled, 88 sec
				11b: Enable Watchdog Timer, 175 sec <default at="" por=""></default>
4	IDPM_AUTO_ DISABLE	R/W	0b	IDPM Auto Disable
	DISABLE			When CELL_BATPRESZ pin is LOW, the charger automatically disables the IDPM function by setting EN_IDPM (REG0x00[1]) to 0. The host can enable IDPM function later by writing EN_IDPM bit (REG0x00[1]) to 1.
				0b: Disable this function. IDPM is not disabled when CELL_BATPRESZ goes LOW. <default at="" por=""></default>
				1b: Enable this function. IDPM is disabled when CELL_BATPRESZ goes LOW.
3	OTG_ON_	R/W	0b	Add OTG to CHRG_OK
	CHRGOK			Drive CHRG_OK to HIGH when the device is in OTG mode.
				0b: Disable <default at="" por=""></default>

8.6.3 ChargeCurrent Register (I2C address = 03/02h) [reset = 0h]

To set the charge current, write a 16-bit ChargeCurrent() command (REG0x03/02h()) using the data format listed in Table 23 and Table 24.

With $10\text{-m}\Omega$ sense resistor, the charger provides charge current range of 64 mA to 8.128 A, with a 64-mA step resolution. Upon POR, when auto wakeup is not active, ChargeCurrent() is 0 A. Any conditions for CHRG_OK low except ACOV will reset ChargeCurrent() to zero. CELL_BATPRESZ going LOW (battery removal) will reset the ChargeCurrent() register to 0 A.

Charge current is not reset in ACOC, TSHUT, power path latch off (REG0x30[1]), and SYSOVP.

A 0.1- μ F capacitor between SRP and SRN for differential mode filtering is recommended; an optional 0.1- μ F capacitor between SRN and ground, and an optional 0.1- μ F capacitor between SRP and ground for common mode filtering. Meanwhile, the capacitance on SRP should not be higher than 0.1 μ F in order to properly sense the voltage across SRP and SRN for cycle-by-cycle current detection.

The SRP and SRN pins are used to sense voltage drop across RSR with default value of 10 m Ω . However, resistors of other values can also be used. For a larger sense resistor, a larger sense voltage is given, and a higher regulation accuracy; but, at the expense of higher conduction loss. A current sensing resistor value no more than 20 m Ω is suggested.

8.6.3.1 **Battery Pre-Charge Current Clamp**

Copyright © 2017-2018, Texas Instruments Incorporated

During pre-charge, BATFET works in linear mode or LDO mode (default REG0x00[2] = 1). For 2-4 cell battery, the system is regulated at minimum system voltage in REG0x0D/0C() and the pre-charge current is clamped at 384 mA. For 1 cell battery, the pre-charge to fast charge threshold is 3 V, and the pre-charge current is clamped at 384 mA. However, the BATFET stays in LDO mode operation till battery voltage is above minimum system voltage (~3.6 V). During battery voltage from 3 V to 3.6 V, the fast charge current is clamped at 2 A.

8.6.4 MaxChargeVoltage Register (I2C address = 05/04h) [reset value based on CELL_BATPRESZ pin setting]

To set the output charge voltage, write a 16-bit ChargeVoltage register command (REG0x05/04()) using the data format listed in Table 25 and Table 26. The charger provides charge voltage range from 1.024 V to 19.200 V, with 16-mV step resolution. Any write below 1.024 V or above 19.200 V is ignored.

Upon POR, REG0x05/04() is by default set as 4192 mV for 1 s, 8400 mV for 2 s, 12592 mV for 3 s or 16800 mV for 4 s. After CHRG_OK, if host writes REG0x03/02() before REG0x05/04(), the charge will start after the write to REG0x03/02(). If the battery is different from 4.2 V/cell, the host has to write to REG0x05/04() before REG0x03/02() for correct battery voltage setting. Writing REG0x05/04() to 0 will set REG0x05/04() to default value on CELL_BATPRESZ pin, and force REG0x03/02() to zero to disable charge.

The SRN pin is used to sense the battery voltage for voltage regulation and should be connected as close to the battery as possible, and directly place a decoupling capacitor (0.1 µF recommended) as close to the device as possible to decouple high frequency noise.

8.6.5.1 System Voltage Regulation

The device employs Narrow VDC architecture (NVDC) with BATFET separating system from battery. The minimum system voltage is set by REG0x0D/0C(). Even with a deeply depleted battery, the system is regulated above the minimum system voltage with BATFET.

When the battery is below minimum system voltage setting, the BATFET operates in linear mode (LDO mode), and the system is regulated above the minimum system voltage setting. As the battery voltage rises above the minimum system voltage, BATFET is fully on when charging or in supplement mode and the voltage difference between the system and battery is the VDS of BATFET. System voltage is regulated 160 mV above battery voltage when BATFET is off (no charging or no supplement current).

When BATFET is removed, the system node VSYS is shorted to SRP. Before the converter starts operation, LDO mode needs to be disabled. The following sequence is required to configure charger without BATFET.

1. Before adapter plugs in, put the charger into HIZ mode. (either pull pin 6 ILIM HIZ to ground, or set

REG0x35[7] to 1)

- 2. Set 0x00[2] to 0 to disable LDO mode.
- 3. Set 0x30[0] to 0 to disable auto-wakeup mode.
- 4. Check if battery voltage is properly programmed (REG0x05/04)
- 5. Set pre-charge/charge current (REG0x03/02)
- 6. Put the device out of HIZ mode. (Release ILIM_HIZ from ground and set REG0x35[7]=0).

In order to prevent any accidental SW mistakes, the host sets low input current limit (a few hundred milliamps) when device is out of HIZ.

8.6.6 Input Current and Input Voltage Registers for Dynamic Power Management

The charger supports Dynamic Power Management (DPM). Normally, the input power source provides power for the system load or to charge the battery. When the input current exceeds the input current setting, or the input voltage falls below the input voltage setting, the charger decreases the charge current to provide priority to the system load. As the system current rises, the available charge current drops accordingly towards zero. If the system load keeps increasing after the charge current drops down to zero, the system voltage starts to drop. As the system voltage drops below the battery voltage, the battery will discharge to supply the heavy system load.

8.6.6.1 Input Current Registers

To set the maximum input current limit, write a 16-bit IIN_HOST register command (REG0x0F/0E()) using the data format listed in Table 29 and Table 30. When using a 10-m Ω sense resistor, the charger provides an input-current limit range of 50 mA to 6400 mA, with 50-mA resolution. The default current limit is 3.3 A. Due to the USB current setting requirement, the register setting specifies the maximum current instead of the typical current. Upon adapter removal, the input current limit is reset to the default value of 3.3 A. The register offset is 50 mA. With code 0, the input current limit is 50 mA.

The ACP and ACN pins are used to sense R_{AC} with the default value of 10 m Ω . For a 20-m Ω sense resistor, a larger sense voltage is given and a higher regulation accuracy, but at the expense of higher conduction loss.

Instead of using the internal DPM loop, the user can build up an external input current regulation loop and have the feedback signal on the ILIM_HIZ pin.

$$V_{\text{ILIM_HIZ}} = 1V + 40 \times (V_{\text{ACP}} - V_{\text{ACN}}) = 1 + 40 \times I_{\text{DPM}} \times R_{\text{AC}}$$
(2)

In order to disable ILIM_HIZ pin, the host can write to 0x32[7] to disable ILIM_HIZ pin, or pull ILIM_HIZ pin above 4.0 V.

8.6.6.1.1 IIN_HOST Register With 10-m Ω Sense Resistor (I2C address = 0F/0Eh) [reset = 4000h]

The register offset is 50 mA. With code 0, the input current limit readback is 50 mA.

8.6.6.1.2 IIN_DPM Register With 10-m Ω Sense Resistor (I2C address = 25/24h) [reset = 0h]

IIN_DPM register reflects the actual input current limit programmed in the register, either from host or from ICO.

After ICO, the current limit used by DPM regulation may differ from the IIN_HOST register settings. The actual DPM limit is reported in REG0x25/24(). The register offset is 50 mA. With code 0, the input current limit read-back is 50 mA.

8.6.6.1.3 InputVoltage Register (I2C address = 0B/0Ah) [reset = VBUS-1.28V]

To set the input voltage limit, write a 16-bit InputVoltage register command (REG0x0B/0A()) using the data format listed in Table 33 and Table 34.

If the input voltage drops more than the InputVoltage register allows, the device enters DPM and reduces the charge current. The default offset voltage is 1.28 V below the no-load VBUS voltage. The DC offset is 3.2 V (0000000).

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The bq2570xEVM-732 evaluation module (EVM) is a complete charger module for evaluating the bq25703A. The application curves were taken using the bq2570xEVM-732. Refer to the EVM user's guide (SLUUBG6) for EVM information.

9.2 Typical Application

Copyright © 2017, Texas Instruments Incorporated

Figure 46. Application Diagram

9.2.1 Design Requirements

DESIGN PARAMETER	EXAMPLE VALUE
Input Voltage ⁽¹⁾	3.5 V < Adapter Voltage < 24 V
Input Current Limit (1)	3.2 A for 65 W adapter
Battery Charge Voltage (2)	8400 mV for 2s battery

- (1) Refer to adapter specification for settings for Input Voltage and Input Current Limit.
- (2) Refer to battery specification for settings.

Typical Application (continued)

DESIGN PARAMETER	EXAMPLE VALUE
Battery Charge Current (2)	3072 mA for 2s battery
Minimum System Voltage (2)	6144 mV for 2s battery

9.2.2 Detailed Design Procedure

The parameters are configurable using the evaluation software. The simplified application circuit (see Figure 46, as the application diagram) shows the minimum component requirements. Inductor, capacitor, and MOSFET selection are explained in the rest of this section. Refer to the EVM user's guide (SLUUBG6) for the complete application schematic.

9.2.2.1 ACP-ACN Input Filter

The bq25703A has average current mode control. The input current sensing through ACP/ACN is critical to recover inductor current ripple. Parasitic inductance on board will generate high frequency ringing on ACP-ACN which overwhelms converter sensed inductor current information, so it is difficult to manage parasitic inductance created based on different PCB layout. Bigger parasitic inductance will generate bigger sense current ringing which will cause the average current control loop to go into oscillation.

For real system board condition, we suggest to use below circuit design to get best result and filter noise induced from different PCB parasitic factor. With time constant of filter from 47 nsec to 200 nsec, the filtering on ringing is effective and in the meantime, the delay of on the sensed signal is small and therefore poses no concern for average current mode control.

Copyright © 2017, Texas Instruments Incorporated

Figure 47. ACN-ACP Input Filter

9.2.2.2 Inductor Selection

The bq25703A has two selectable fixed switching frequency. Higher switching frequency allows the use of smaller inductor and capacitor values. Inductor saturation current should be higher than the charging current (I_{CHG}) plus half the ripple current (I_{RIPPLE}):

$$I_{SAT} \ge I_{CHG} + (1/2)I_{RIPPLE}$$
 (3)

The inductor ripple current in buck operation depends on input voltage (V_{IN}) , duty cycle $(D_{BUCK} = V_{OUT}/V_{IN})$, switching frequency (f_S) and inductance (L):

$$I_{RIPPLE_BUCK} = \frac{V_{IN} \times D \times (1 - D)}{f_{S} \times L}$$
(4)

During boost operation, the duty cycle is:

 $D_{BOOST} = 1 - (V_{IN}/V_{BAT})$ and the ripple current is:

 $I_{RIPPLE BOOST} = (VIN \times D_{BOOST}) / (f_S \times L)$

The maximum inductor ripple current happens with D = 0.5 or close to 0.5. For example, the battery charging voltage range is from 9 V to 12.6 V for 3-cell battery pack. For 20-V adapter voltage, 10-V battery voltage gives the maximum inductor ripple current. Another example is 4-cell battery, the battery voltage range is from 12 V to 16.8 V, and 12-V battery voltage gives the maximum inductor ripple current.

Usually inductor ripple is designed in the range of (20 - 40%) maximum charging current as a trade-off between inductor size and efficiency for a practical design.

9.2.2.3 Input Capacitor

Bulk input capacitors should be locate in front of input current sensing resistor. Do not recommend to put bulk input capacitors between input sensing resistor and switching MOSFET. Input capacitor should have enough ripple current rating to absorb input switching ripple current. The worst case RMS ripple current is half of the charging current when duty cycle is 0.5 in buck mode. If the converter does not operate at 50% duty cycle, then the worst case capacitor RMS current occurs where the duty cycle is closest to 50% and can be estimated by Equation 5:

$$I_{CIN} = I_{CHG} \times \sqrt{D \times (1 - D)}$$
(5)

Low ESR ceramic capacitor such as X7R or X5R is preferred for input decoupling capacitor and should be placed to the drain of the high side MOSFET and source of the low side MOSFET as close as possible. Voltage rating of the capacitor must be higher than normal input voltage level. 25 V rating or higher capacitor is preferred for 19 V - 20 V input voltage. Minimum 10- μ F effective capacitance (7 pcs of 10- μ F 0805 size capacitor) is suggested for 45 W-65 W adapter.

Ceramic capacitors show a dc-bias effect. This effect reduces the effective capacitance when a dc-bias voltage is applied across a ceramic capacitor, as on the input capacitor of a charger. The effect may lead to a significant capacitance drop, especially for high input voltages and small capacitor packages. See the manufacturer's datasheet about the performance with a dc bias voltage applied. It may be necessary to choose a higher voltage rating or nominal capacitance value in order to get the required value at the operating point.

9.2.2.4 Output Capacitor

Output capacitor also should have enough ripple current rating to absorb output switching ripple current. In buck mode the output capacitor RMS current is given:

To get good loop stability, the resonant frequency of the output inductor and output capacitor should be designed between 10 kHz and 20 kHz. The preferred ceramic capacitor is 25-V X7R or X5R for output capacitor. Minimum $10-\mu F$ effective capacitance (7 pcs of $10-\mu F$ 0805 size capacitor) is suggested to be placed by the inductor, and $50-\mu F$ effective distributed capacitance on Vsys output. Place the capacitors after Q4 drain. Place minimum 10 μF after the charge current sense resistor for best stability.

Ceramic capacitors show a dc-bias effect. This effect reduces the effective capacitance when a dc-bias voltage is applied across a ceramic capacitor, as on the output capacitor of a charger. The effect may lead to a significant capacitance drop, especially for high output voltages and small capacitor packages. See the manufacturer's data sheet about the performance with a dc bias voltage applied. It may be necessary to choose a higher voltage rating or nominal capacitance value in order to get the required value at the operating point.

9.2.2.5 Power MOSFETs Selection

Four external N-channel MOSFETs are used for a synchronous switching battery charger. The gate drivers are internally integrated into the IC with 6 V of gate drive voltage. 30 V or higher voltage rating MOSFETs are preferred for 19 V - 20 V input voltage.

Figure-of-merit (FOM) is usually used for selecting proper MOSFET based on a tradeoff between the conduction loss and switching loss. For the top side MOSFET, FOM is defined as the product of a MOSFET's on-resistance, $R_{DS(ON)}$, and the gate-to-drain charge, Q_{GD} . For the bottom side MOSFET, FOM is defined as the product of the MOSFET's on-resistance, $R_{DS(ON)}$, and the total gate charge, Q_{G} .

$$FOM_{top} = R_{DS(on)} \times Q_{GD}$$
; $FOM_{bottom} = R_{DS(on)} \times Q_{GD}$

The lower the FOM value, the lower the total power loss. Usually lower $R_{DS(ON)}$ has higher cost with the same package size.

The top-side MOSFET loss includes conduction loss and switching loss. It is a function of duty cycle (D= V_{OUT}/V_{IN}), charging current (I_{CHG}), MOSFET's on-resistance ($R_{DS(ON)}$), input voltage (V_{IN}), switching frequency (f_S), turn on time (t_{on}) and turn off time (t_{off}):

$$P_{\text{top}} = D \times I_{\text{CHG}}^2 \times R_{\text{DS(on)}} + \frac{1}{2} \times V_{\text{IN}} \times I_{\text{CHG}} \times (t_{\text{on}} + t_{\text{off}}) \times f_{\text{s}}$$
(7)

The first item represents the conduction loss. Usually MOSFET $R_{DS(ON)}$ increases by 50% with 100°C junction temperature rise. The second term represents the switching loss. The MOSFET turn-on and turn-off times are given by:

$$t_{on} = \frac{Q_{SW}}{I_{on}}, \quad t_{off} = \frac{Q_{SW}}{I_{off}}$$
(8)

where Q_{sw} is the switching charge, I_{on} is the turn-on gate driving current and I_{off} is the turn-off gate driving current. If the switching charge is not given in MOSFET datasheet, it can be estimated by gate-to-drain charge (Q_{GD}) and gate-to-source charge (Q_{GS}) :

$$Q_{SW} = Q_{GD} + \frac{1}{2} \times Q_{GS}$$
 (9)

Gate driving current can be estimated by REGN voltage (V_{REGN}), MOSFET plateau voltage (V_{plt}), total turn-on gate resistance (R_{on}) and turn-off gate resistance (R_{off}) of the gate driver:

$$I_{on} = \frac{V_{REGN} - V_{plt}}{R_{on}}, \quad I_{off} = \frac{V_{plt}}{R_{off}}$$
(10)

The conduction loss of the bottom-side MOSFET is calculated with the following equation when it operates in synchronous continuous conduction mode:

$$P_{\text{bottom}} = (1 - D) \times I_{\text{CHG}}^2 \times R_{\text{DS(on)}}$$

$$(11)$$

When charger operates in non-synchronous mode, the bottom-side MOSFET is off. As a result all the freewheeling current goes through the body-diode of the bottom-side MOSFET. The body diode power loss depends on its forward voltage drop (V_F) , non-synchronous mode charging current $(I_{NONSYNC})$, and duty cycle (D).

$$P_{D} = V_{F} \times I_{NONSYNC} \times (1 - D)$$

$$(12)$$

The maximum charging current in non-synchronous mode can be up to 0.25 A for a $10\text{-m}\Omega$ charging current sensing resistor or 0.5 A if battery voltage is below 2.5 V. The minimum duty cycle happens at lowest battery voltage. Choose the bottom-side MOSFET with either an internal Schottky or body diode capable of carrying the maximum non-synchronous mode charging current.

9.2.3 Application Curves

10 Power Supply Recommendations

The valid adapter range is from 3.5 V (V_{VBUS_CONVEN}) to 24 V (ACOV) with at least 500-mA current rating. When CHRG_OK goes HIGH, the system is powered from adapter through the charger. When adapter is removed, the system is connected to battery through BATFET. Typically the battery depletion threshold should be greater than the minimum system voltage so that the battery capacity can be fully utilized for maximum battery life.

11 Layout

11.1 Layout Guidelines

The switching node rise and fall times should be minimized for minimum switching loss. Proper layout of the components to minimize high frequency current path loop (see *Layout Example* section) is important to prevent electrical and magnetic field radiation and high frequency resonant problems. Here is a PCB layout priority list for proper layout. Layout PCB according to this specific order is essential.

- 1. Place the input capacitor as close as possible to the supply of the switching MOSFET and ground connections. Use a short copper trace connection. These parts must be placed on the same layer of PCB using vias to make this connection.
- The device must be placed close to the gate pins of the switching MOSFET. Keep the gate drive signal traces short for a clean MOSFET drive. The device can be placed on the other side of the PCB of switching MOSFETs.
- 3. Place an inductor input pin as close as possible to the output pin of the switching MOSFET. Minimize the copper area of this trace to lower electrical and magnetic field radiation but make the trace wide enough to carry the charging current. Do not use multiple layers in parallel for this connection. Minimize parasitic capacitance from this area to any other trace or plane.
- 4. The charging current sensing resistor should be placed right next to the inductor output. Route the sense leads connected across the sensing resistor back to the device in same layer, close to each other (minimize loop area) and do not route the sense leads through a high-current path (see Figure 66 for Kelvin connection for best current accuracy). Place a decoupling capacitor on these traces next to the device.
- 5. Place an output capacitor next to the sensing resistor output and ground.
- 6. Output capacitor ground connections must be tied to the same copper that connects to the input capacitor ground before connecting to system ground.
- 7. Use a single ground connection to tie the charger power ground to the charger analog ground. Just beneath the device, use analog ground copper pour but avoid power pins to reduce inductive and capacitive noise coupling.
- 8. Route analog ground separately from power ground. Connect analog ground and connect power ground separately. Connect analog ground and power ground together using power pad as the single ground connection point. Or using a $0-\Omega$ resistor to tie analog ground to power ground (power pad should tie to analog ground in this case if possible).
- 9. Decoupling capacitors must be placed next to the device pins. Make trace connection as short as possible.
- 10. It is critical that the exposed power pad on the backside of the device package be soldered to the PCB ground.
- 11. The via size and number should be enough for a given current path. See the EVM design (SLUUBG6) for the recommended component placement with trace and via locations. For WQFN information, see SLUA271.

12.1.1 Third-Party Products Disclaimer

TI'S PUBLICATION OF INFORMATION REGARDING THIRD-PARTY PRODUCTS OR SERVICES DOES NOT CONSTITUTE AN ENDORSEMENT REGARDING THE SUITABILITY OF SUCH PRODUCTS OR SERVICES OR A WARRANTY, REPRESENTATION OR ENDORSEMENT OF SUCH PRODUCTS OR SERVICES, EITHER ALONE OR IN COMBINATION WITH ANY TI PRODUCT OR SERVICE.

12.2 Documentation Support

12.2.1 Related Documentation

For related documentation see the following:

- Semiconductor and IC Package Thermal Metrics Application Report SPRA953
- bg2570x Evaluation Module User's Guide SLUUBG6
- QFN/SON PCB Attachment Application Report SLUA271

12.3 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

12.4 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

TI E2E™ Online Community TI's Engineer-to-Engineer (E2E) Community. Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

Design Support *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

12.5 Trademarks

E2E is a trademark of Texas Instruments.

All other trademarks are the property of their respective owners.

12.6 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

12.7 Glossary

SLYZ022 — TI Glossary.

This glossary lists and explains terms, acronyms, and definitions.

13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

TEXAS INSTRUMENTS

13.1 Package Option Addendum

13.1.1 Packaging Information

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish ⁽³⁾	MSL Peak Temp (4)	Op Temp (°C)	Device Marking ⁽⁵⁾⁽⁶⁾
bq25703ARSNR	PREVIEW	WQFN	RSN	32	3000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR	-40 to 85	bq25703A
bq25703ARSNT	PREVIEW	WQFN	RSN	32	250	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR	-40 to 85	bq25703A

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PRE_PROD Unannounced device, not in production, not available for mass market, nor on the web, samples not available.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

- (3) Lead/Ball Finish Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.
- (4) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
- (5) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device
- (6) Multiple Device markings will be inside parentheses. Only on Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

MECHANICAL DATA

- All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994. This drawing is subject to change without notice. QFN (Quad Flatpack No-Lead) Package configuration. NOTES:

 - B. C.
 - The package thermal pad must be soldered to the board for thermal and mechanical performance.
 - E. See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.

THERMAL PAD MECHANICAL DATA

RSN (S-PWQFN-N32)

PLASTIC QUAD FLATPACK NO-LEAD

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No—Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

NOTE: All linear dimensions are in millimeters

LAND PATTERN DATA

RSN (S-PWQFN-N32)

PLASTIC QUAD FLATPACK NO-LEAD

- NOTES: All linear dimensions are in millimeters.

 - This drawing is subject to change without notice. Publication IPC-7351 is recommended for alternate designs.
 - This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, Quad Flat-Pack Packages, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com www.ti.com.
 - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
 - Customers should contact their board fabrication site for recommended solder mask tolerances and via tenting recommendations for vias placed in the thermal pad.

⁽¹⁾ Status: For more details on status, see our product life cycle.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

⁽²⁾ Material type: When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ RoHS values: Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

⁽⁴⁾ Lead finish/Ball material: Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ MSL rating/Peak reflow: The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ Part marking: There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.
