

CC1314R10 SWRS270B - DECEMBER 2022 - REVISED APRIL 2024

CC1314R10 SimpleLink™ High-Performance Sub-1GHz Wireless MCU

1 Features

Wireless microcontroller

- Powerful 48MHz Arm® Cortex®-M33 processor with TrustZone®
- FPU and DSP extension
- 1024kB flash program memory
- · 8kB of cache SRAM
- 256kB of ultra-low leakage SRAM with parity for high-reliability operation
 - 32kB of additional SRAM if parity is disabled
- Dynamic multiprotocol manager (DMM) driver
- Supports over-the-air update (OTA)

Ultra-low power sensor controller

- Autonomous MCU with 4kB of SRAM
- Sample, store, and process sensor data
- Fast wake-up for low-power operation
- Software defined peripherals; capacitive touch, flow meter, LCD

Low power consumption

- MCU consumption:
 - 3.4mA active mode, CoreMark®
 - 71µA/MHz running CoreMark®
 - 0.98µA standby mode, RTC, 256kB SRAM
 - 0.17μA shutdown mode, wake-up on pin
- Ultra-low-power sensor controller consumption
 - 32µA in 2MHz mode
 - 849µA in 24MHz mode
- Radio consumption:
 - 5.8mA RX at 868MHz
 - 25.8mA TX at +14dBm at 868MHz

Wireless protocol support

- Wi-SUN®
- mioty®
- Amazon Sidewalk
- Wireless M-Bus
- SimpleLink™ TI 15.4-Stack (Sub-1GHz)
- **Proprietary Systems**

High-performance radio

- -121dBm for 2.5kbps long-range mode
- -110dBm at 50kbps, 802.15.4, 868MHz

Regulatory compliance

- Designed for systems targeting compliance with these standards:
 - ETSI EN 300 220 Receiver Cat. 1.5 and 2, EN
 - 303 131, EN 303 204

- FCC CFR47 Part 15
- ARIB STD-T108 and STD-T67

MCU peripherals

- Most digital peripherals can be routed to any GPIO
- Four 32-bit or eight 16-bit general-purpose timers
- 12-bit SAR ADC, 200ksps, 8 channels
- 8-bit DAC
- Two comparators
- Programmable current source
- Four UART, four SPI, two I²C, one I²S
- Real-time clock (RTC)
- Integrated temperature and battery monitor

Security enablers

- Supports secure boot
- Supports secure key storage and device ID
- Arm® TrustZone® for a trusted execution environment
- AES 128-bit and 256-bit cryptographic accelerator
- Public key accelerator
- SHA2 accelerator (full suite up to SHA-512)
- True random number generator (TRNG)
- Secure debug lock
- Software anti-rollback protection

Development tools and software

- LP-EM-CC1314R10
- LP-XDS110, LP-XDS110ET or TMDSEMU110-U (with TMDSEMU110-ETH add-on) Debug Probe
- SimpleLink™ LOWPOWER F2 Software Development Kit (SDK)
- SmartRF™ Studio for simple radio configuration
- Sensor Controller Studio for building low-power sensing applications
- SysConfig system configuration tool

Operating range

- On-chip buck DC/DC converter
- 1.8V to 3.8V single supply voltage
- -40°C to +105°C

Package

- 7mm × 7mm RGZ VQFN48 (30 GPIOs)
- 8mm × 8mm RSK VQFN64 (46 GPIOs)
- RoHS-compliant package

2 Applications

- 315MHz, 433MHz, 470MHz to 510MHz, 868MHz, and 902MHz to 928MHz ISM and SRD systems¹ with down to 4kHz of receive bandwidth
- **Building automation**
- 1 See RF Core for additional details on supported protocol standards, modulation formats, and data rates.

- Building security systems—motion detector, electronic smart lock, door and window sensor. garage door system, gateway
- HVAC—thermostat, wireless environmental sensor, HVAC system controller, gateway
- Fire safety system—smoke and heat detector, fire alarm control panel (FACP)
- Video surveillance—IP network camera
- Elevators and escalators—elevator main control panel for elevators and escalators
- Grid infrastructure
 - Smart meters—water meter, gas meter, electricity meter, and heat cost allocators
 - Grid communications—wireless communications and long-range sensor applications

- Other alternative energy—energy harvesting, solar inverters
- Industrial transportation—asset tracking
- Factory automation and control
- Medical
- Electronic point of sale (EPOS)—Electronic Shelf Label (ESL)
- Personal electronics
 - Connected peripherals—consumer wireless module
 - Home theater & entertainment—smart speakers, set-top box
 - Gaming
 - Wearables (non-medical)

3 Description

The SimpleLink[™] CC1314R10 device is a low-power, Sub-1GHz wireless microcontroller (MCU) targeting applications needing enhanced security, on-chip over-the-air update capability, and support for advanced applications or large wireless protocols. It supports IEEE 802.15.4, IPv6-enabled smart objects (6LoWPAN), Wireless M-Bus, Wi-SUN, Amazon Sidewalk, mioty, and proprietary systems, including the TI 15.4-Stack (Sub-1GHz). The device is optimized for low-power wireless communication and advanced sensing in building security systems, HVAC, smart meters, medical, wired networking, gateways and grid communications, home theater and entertainment, and connected peripherals markets. The highlighted features of this device include:

- Arm® TrustZone® based secure key storage, device ID, and trusted functions support.
- Flexible Sub-1 GHz radio supporting industry standard frequency bands (315MHz, 433MHz, 868MHz, 915MHz, and more) to meet industrial needs.
- Wide flexibility of protocol stack support in the SimpleLink LOWPOWER F2 Software Development Kit (SDK) including Wi-SUN, Amazon Sidewalk, and SimpleLink™ 15.4-Stack (Sub-1GHz).
- Maximum transmit power of +14dBm at Sub-1GHz with 25.8mA current consumption.
- Longer battery life wireless applications with a low standby current of 0.98µA and full SRAM retention.
- Industrial temperature ready with lowest standby current of approximately 13µA at 105°C (with full SRAM retention).
- Advanced sensing with a programmable, autonomous ultra-low power Sensor Controller CPU with fast wake-up capability. As an example, the sensor controller is capable of 1Hz ADC sampling at 1.2µA system current.
- Low Soft Error Rate (SER) Failure-in-time (FIT) for long operation lifetime with no disruption for industrial markets with always-on SRAM parity against corruption due to potential radiation events.
- Dedicated software-controlled radio controller (Arm® Cortex®-M0) providing flexible low-power RF transceiver capability to support multiple physical layers and RF standards.
- Excellent radio sensitivity (–121dBm) and robustness (selectivity and blocking) performance for SimpleLink™ long-range mode.

The CC1314R10 device is part of the SimpleLink™ MCU platform, which consists of Wi-Fi®, Bluetooth® Low Energy, Thread, Zigbee®, Sub-1GHz MCUs, and host MCUs that all share a common, easy-to-use development environment with a single core software development kit (SDK) and rich tool set. A one-time integration of the SimpleLink™ platform enables you to add any combination of the portfolio's devices into your design, allowing 100 percent code reuse when your design requirements change. For more details, see the SimpleLink MCU platform.

In addition to the software compatibility, within the Sub-1GHz wireless MCUs, there is pin-to-pin compatibility from 32kB of flash up to 1MB of flash in the 7mm × 7mm QFN package for maximum design scalability. For more information on TI's Sub-1GHz devices, see www.ti.com/sub1ghz.

DIO_30	43	I/O	Digital or Analog	GPIO, analog capability
EGP	_	_	GND	Ground—exposed ground pad ⁽³⁾
JTAG_TMSC	24	I/O	Digital	JTAG TMSC, high-drive capability
JTAG_TCKC	25	I	Digital	JTAG TCKC
RESET_N	35	I	Digital	Reset, active low. No internal pullup resistor
RF_P	1	_	RF	Positive RF input signal to LNA during RX Positive RF output signal from PA during TX
RF_N	2	_	RF	Negative RF input signal to LNA during RX Negative RF output signal from PA during TX
RX_TX	3	_	RF	Optional bias pin for the RF LNA
VDDR	45	_	Power	Internal supply, must be powered from the internal DC/DC converter or the internal LDO ⁽²⁾ (4) (6)

Table 6-1. Signal Descriptions—RGZ Package (continued)

PIN		I/O	TYPE	DESCRIPTION
NAME	NO.	1/0	ITPE	DESCRIPTION
VDDR_RF	48	_	Power	Internal supply, must be powered from the internal DC/DC converter or the internal LDO ⁽²⁾ (5) (6)
VDDS	44	_	Power	1.8V to 3.8V main chip supply ⁽¹⁾
VDDS2	13	_	Power	1.8V to 3.8V DIO supply ⁽¹⁾
VDDS3	22	_	Power	1.8V to 3.8V DIO supply ⁽¹⁾
VDDS_DCDC	34	_	Power	1.8V to 3.8V DC/DC converter supply
X48M_N	46	_	Analog	48MHz crystal oscillator pin N
X48M_P	47	_	Analog	48MHz crystal oscillator pin P
X32K_Q1	4	_	Analog	32kHz crystal oscillator pin 1
X32K_Q2	5	_	Analog	32kHz crystal oscillator pin 2

- (1) For more details, see the technical reference manual listed in Section 10.2.
- (2) Do not supply external circuitry from this pin.
- (3) EGP is the only ground connection for the device. A good electrical connection to the device ground on a printed circuit board (PCB) is imperative for proper device operation.
- (4) If an internal DC/DC converter is not used, this pin is supplied internally from the main LDO.
- 5) If an internal DC/DC converter is not used, this pin must be connected to VDDR for supply from the main LDO.
- (6) Output from internal DC/DC and LDO is trimmed to 1.68V.

6.3 Connections for Unused Pins and Modules—RGZ Package

Table 6-2. Connections for Unused Pins—RGZ Package

FUNCTION	SIGNAL NAME	PIN NUMBER	ACCEPTABLE PRACTICE(1)	PREFERRED PRACTICE ⁽¹⁾
GPIO	DIO_n	6–12 14–21 26–32 36–43	NC or GND	NC
32.768 kHz crystal	X32K_Q1	4	NC or GND	NC
32.700 Ki iz Ci ystai	X32K_Q2	5	INC OF GIND	NO
DC/DC converter ⁽²⁾	DCDC_SW	33	NC	NC
DO/DO CONVENIENCE	VDDS_DCDC	34	VDDS	VDDS

- (1) NC = No connect
- (2) When the DC/DC converter is not used, the inductor between DCDC_SW and VDDR can be removed. VDDR and VDDR_RF must still be connected and the 22µF DCDC capacitor must be kept on the VDDR net.

- (3) EGP is the only ground connection for the device. Good electrical connection to device ground on printed circuit board (PCB) is imperative for proper device operation.
- (4) If internal DC/DC converter is not used, this pin is supplied internally from the main LDO.
- (5) If internal DC/DC converter is not used, this pin must be connected to VDDR for supply from the main LDO.
- (6) Output from internal DC/DC and LDO is trimmed to 1.68V.

6.6 Connection of Unused Pins and Module—RSK Package

Table 6-4. Connections for Unused Pins—RSK Package

Table 5 41 Commodicite for Chacca 1 inc. 1 Coll 1 ackage										
FUNCTION	SIGNAL NAME	PIN NUMBER	ACCEPTABLE PRACTICE(1)	PREFERRED PRACTICE(1)						
GPIO	DIO_n	6–16, 18–29 34–46, 50–59	NC or GND	NC						
22.760kl la envetel	X32K_Q1	4	NC or GND	NC						
32.768kHz crystal	X32K_Q2	5	INC OF GIND	INC						
DC/DC converter ⁽²⁾	DCDC_SW	47	NC	NC						
DO/DC converter	VDDS_DCDC	48	VDDS	VDDS						

⁽¹⁾ NC = No connect

Product Folder Links: CC1314R10

When the DC/DC converter is not used, the inductor between DCDC SW and VDDR can be removed. VDDR and VDDR RF must still (2) be connected and the 22 μF DCDC capacitor must be kept on the VDDR net.

7 Specifications

7.1 Absolute Maximum Ratings

Over operating free-air temperature range (unless otherwise noted)(1) (2)

			MIN	MAX	UNIT
VDDS ⁽³⁾	Supply voltage		-0.3	4.1	V
	Voltage on any digital pin	(4) (5)	-0.3	VDDS + 0.3, max 4.1	V
	Voltage on crystal oscilla	tor pins, X32K_Q1, X32K_Q2, X48M_N and X48M_P	-0.3	VDDR + 0.3, max 2.25	V
		Voltage scaling enabled	-0.3	VDDS	
V _{in}	Voltage on ADC input	Voltage scaling disabled, internal reference	-0.3	1.49	V
		Voltage scaling disabled, VDDS as reference	-0.3	0.3 1.49 V	
	Input level, RF pins			10	dBm
T _{stg}	Storage temperature		-40	150	°C

- Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
- (2) All voltage values are with respect to ground, unless otherwise noted.
- (3) VDDS_DCDC, VDDS2, and VDDS3 must be at the same potential as VDDS.
- (4) Including analog capable DIOs.
- (5) Injection current is not supported on any GPIO pin.

7.2 ESD Ratings

					VALUE	UNIT
	V _{ESD} EI	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	All pins	±2000	V
		Electrostatic discharge	Charged device model (CDM), per ANSI/ESDA/JEDEC JS-002 ⁽²⁾	All pins	±500	V

- (1) JEDEC document JEP155 states that 500V HBM allows safe manufacturing with a standard ESD control process
- (2) JEDEC document JEP157 states that 250V CDM allows safe manufacturing with a standard ESD control process

7.3 Recommended Operating Conditions

Over operating free-air temperature range (unless otherwise noted)

	MIN	MAX	UNIT
Operating ambient temperature ^{(1) (3)}		105	°C
Operating supply voltage (VDDS)		3.8	V
Operating supply voltage (VDDS), boost mode VDDR = 1.95V +14dBm RF output power	2.1	3.8	V
Rising supply voltage slew rate	0	100	mV/µs
Falling supply voltage slew rate ⁽²⁾	0	20	mV/µs

- (1) Operation at or near maximum operating temperature for extended durations will result in lifetime reduction.
- (2) For small coin-cell batteries, with high worst-case end-of-life equivalent source resistance, a 22 μF VDDS input capacitor must be used to ensure compliance with this slew rate.
- (3) For thermal resistance characteristics refer to Thermal Resistance Characteristics. For application considerations, refer to SPRA953

7.4 Power Supply and Modules

Over operating free-air temperature range (unless otherwise noted).

PARAMETER		MIN	TYP	MAX	UNIT
VDDS Power-on-Reset (POR) threshold		1.	1 - 1.55		V
VDDS Brown-out Detector (BOD) (1)	Rising threshold		1.77		V
VDDS Brown-out Detector (BOD), before initial boot (2)	Rising threshold		1.70		V

Copyright © 2024 Texas Instruments Incorporated

Submit Document Feedback

7.4 Power Supply and Modules (continued)

Over operating free-air temperature range (unless otherwise noted).

PARAMETER		MIN	TYP	MAX	UNIT
VDDS Brown-out Detector (BOD) (1)	Falling threshold		1.75		V

- (1) For boost mode (VDDR =1.95 V), TI drivers software initialization will trim VDDS BOD limits to maximum (approximately 2.0 V).
- (2) Brown-out Detector is trimmed at initial boot, value is kept until device is reset by a POR reset or the RESET_N pin.

7.5 Power Consumption—Power Modes

When measured on the LP-EM-CC1314R10 reference design with T_c = 25°C, V_{DDS} = 3.6V with DC/DC enabled unless otherwise noted.

	PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Core Curr	ent Consumption					
	Reset and Shutdown	Reset. RESET_N pin asserted or VDDS below power-on-reset threshold		150		nA

7.5 Power Consumption—Power Modes (continued)

When measured on the LP-EM-CC1314R10 reference design with T_c = 25°C, V_{DDS} = 3.6V with DC/DC enabled unless otherwise noted.

PA	RAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
	Active mode	24MHz, infinite loop, V _{DDS} = 3.0V		849		uА
ISCE	Low-power mode	2MHz, infinite loop, V _{DDS} = 3.0V		32		μΑ

- (1) Only one GPTimer running
- (2) Only one SPI running
- (3) Only one UART running

7.6 Power Consumption—Radio Modes

When measured on the LP-EM-CC1314R10 reference design with T_c = 25°C, V_{DDS} = 3.6V with DC/DC enabled unless otherwise noted.

Using boost mode (increasing VDDR up to 1.95 V), will increase system current by 15% (does not apply to TX +14dBm setting where this current is already included).

Relevant I_{core} and I_{peri} currents are included in below numbers.

	PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
I _{radio}	Radio receive current, 868MHz			5.8		mA
		0dBm output power setting 868MHz		9.5		mA
I _{radio}		+10dBm output power setting 868MHz		14.1		mA
		+14dBm output power setting 868MHz		25.8		mA

7.7 Nonvolatile (Flash) Memory Characteristics

Over operating free-air temperature range and V_{DDS} = 3.0V (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Flash sector size			2		kB
Supported flash erase cycles before failure, full bank ⁽¹⁾ (2)		30			k Cycles
Supported flash erase cycles before failure, single sector ⁽³⁾		60			k Cycles
Maximum number of write operations per row before sector erase ⁽⁴⁾				83	Write Operations
Flash retention	105 °C Tj	11.4			Years
Flash sector erase current	Average delta current		1.0		mA
Flash sector erase time ⁽⁵⁾	Zero cycles		10		ms
I lasti sector erase unie	30k cycles			4000	ms

- (1) A full bank erase is counted as a single erase cycle on each sector.
- (2) Aborting flash during erase or program modes is not a safe operation.
- (3) Up to 4 customer-designated sectors can be individually erased an additional 30k times beyond the baseline bank limitation of 30k cycles.
- (4) Each wordline is 2048 bits (or 256 bytes) wide. This limitation corresponds to sequential memory writes of 4 (3.1) bytes minimum per write over a whole wordline. If additional writes to the same wordline are required, a sector erase is required once the maximum number of write operations per row is reached.
- (5) This number is dependent on Flash aging and increases over time and erase cycles.

	±10000kHz offset		-140		dBc/Hz

7.14 Timing and Switching Characteristics

7.14.1 Reset Timing

PARAMETER	MIN	TYP	MAX	UNIT
RESET_N low duration	1			μs

Product Folder Links: CC1314R10

⁽²⁾ Suitable for systems targeting compliance with EN 300 220, EN 303 131, EN 303 204, FCC CFR47 Part 15, ARIB STD-T108.

7.14.2 Wakeup Timing

Measured over operating free-air temperature with V_{DDS} = 3.0V (unless otherwise noted). The times listed here do not include software overhead.

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
MCU, Reset to Active ⁽¹⁾		8	50 - 4000		μs
MCU, Shutdown to Active ⁽¹⁾		850 - 4000		μs	
MCU, Standby to Active			160		μs
MCU, Active to Standby			39		μs
MCU, Idle to Active			15		μs

⁽¹⁾ The wakeup time is dependent on remaining charge on VDDR capacitor when starting the device, and thus how long the device has been in Reset or Shutdown before starting up again. The wake up time increases with a higher capacitor value.

7.14.3 Clock Specifications

7.14.3.1 48MHz Clock Input (TCXO)

Measured on a Texas Instruments reference design with T_c = 25°C, V_{DDS} = 3.0V, unless otherwise noted.⁽¹⁾

PARAMETER	TEST CONDITIONS	MIN	TYP MAX	UNIT
Clock frequency			48	MHz
TCXO clipped sine output, peak-to-peak	TCXO clipped sine output connected to pin X48M_P through series capacitor	0.8	1.7	V
TCXO with CMOS output, High input voltage	TCXO with CMOS output directly	1.3	VDDR	V
TCXO with CMOS output, Low input voltage	coupled to pin X48M_P	0	0.3	V

⁽¹⁾ Probing or otherwise stopping the TCXO while the DC/DC converter is enabled may cause permanent damage to the device.

7.14.3.2 48MHz Crystal Oscillator (XOSC_HF)

Measured on a Texas Instruments reference design with T_c = 25°C, V_{DDS} = 3.0V, unless otherwise noted.⁽¹⁾

	PARAMETER	MIN	TYP	MAX	UNIT
F	Crystal frequency		48		MHz
ESR	Equivalent series resistance $6 pF < C_L \le 9 pF$		20	60	Ω
ESR	Equivalent series resistance 5 pF < C _L ≤ 6 pF			80	Ω
L _M	Motional inductance, relates to the load capacitance that is used for the crystal (C _L in Farads) ⁽²⁾	< 3 × 10 ⁻²⁵ / C _L ²		Н	
C _L	Crystal load capacitance ⁽³⁾	5	7 ⁽⁴⁾	9	pF
t	Start-up time ⁽⁵⁾		200		μs

- (1) Probing or otherwise stopping the crystal while the DC/DC converter is enabled may cause permanent damage to the device.
- (2) The crystal manufacturer's specification must satisfy this requirement for proper operation.
- (3) Adjustable load capacitance is integrated into the device. External load capacitors are required for systems targeting compliance with certain regulations. See the device errata for further details.
- (4) On-chip default connected capacitance including reference design parasitic capacitance. Connected internal capacitance is changed through software in the Customer Configuration section (CCFG).
- (5) Start-up time using the TI-provided power driver. Start-up time may increase if driver is not used.

7.14.3.3 48MHz RC Oscillator (RCOSC_HF)

Measured on a Texas Instruments reference design with T_c = 25°C, V_{DDS} = 3.0V, unless otherwise noted.

	MIN	TYP	MAX	UNIT
Frequency		48		MHz
Uncalibrated frequency accuracy		±1		%
Calibrated frequency accuracy ⁽¹⁾		±0.25		%
Start-up time		5		μs

⁽¹⁾ Accuracy relative to the calibration source (XOSC_HF).

7.14.3.4 2MHz RC Oscillator (RCOSC_MF)

Measured on a Texas Instruments reference design with T_c = 25°C, V_{DDS} = 3.0V, unless otherwise noted.

	MIN	TYP	MAX	UNIT
Calibrated frequency		2		MHz
Start-up time		5		μs

7.14.3.5 32.768 kHz Crystal Oscillator (XOSC_LF)

Measured on a Texas Instruments reference design with T_c = 25°C, V_{DDS} = 3.0V, unless otherwise noted.

	MIN	TYP	MAX	UNIT
Crystal frequency		32.768		kHz

Product Folder Links: CC1314R10

7.14.3.5 32.768 kHz Crystal Oscillator (XOSC_LF) (continued)

Measured on a Texas Instruments reference design with $T_c = 25$ °C, $V_{DDS} = 3.0$ V, unless otherwise noted.

		MIN	TYP	MAX	UNIT
ESR	Equivalent series resistance		30	100	kΩ
C _L	Crystal load capacitance	6	7 ⁽¹⁾	12	pF

(1) Default load capacitance using TI reference designs including parasitic capacitance. Crystals with different load capacitance may be used.

7.14.3.6 32 kHz RC Oscillator (RCOSC_LF)

Measured on a Texas Instruments reference design with T_c = 25°C, V_{DDS} = 3.0V, unless otherwise noted.

	MIN	TYP	MAX	UNIT
Calibrated frequency		32.8 ⁽¹⁾		kHz
Temperature coefficient.		50		ppm/°C

(1) When using RCOSC_LF as source for the low frequency system clock (SCLK_LF), the accuracy of the SCLK_LF-derived Real Time Clock (RTC) can be improved by measuring RCOSC_LF relative to XOSC_HF and compensating for the RTC tick speed. This functionality is available through the TI-provided Power driver.

7.14.4 Serial Peripheral Interface (SPI) Characteristics

7.14.4.1 SPI Characteristics

over operating free-air temperature range (unless otherwise noted).

	PARAMETERS	TEST CONDITIONS	MIN	TYP	MAX	UNIT
		Master Mode 1.8 < VDDS < 3.8			12	
f _{SCLK} 1/t _{sclk}	SPI clock frequency	Slave Mode 2.7 < VDDS < 3.8			8	MHz
		Slave Mode VDDS < 2.7			7	
DC _{SCK}	SCK Duty Cycle		45	50	55	%

7.14.4.2 SPI Master Mode

over operating free-air temperature range (unless otherwise noted).

	PARAMETERS	TEST CONDITIONS	MIN	TYP MAX	UNIT
t _{SCLK_H/} L	SCLK High or Low time		(t _{SPI} /2) - 1	t _{SPI} / 2 (t _{SPI} /2) + 1	ns

7.15.1.1 Analog-to-Digital Converter (ADC) Characteristics (continued)

 T_c = 25°C, V_{DDS} = 3.0V and voltage scaling enabled, unless otherwise noted.⁽¹⁾

Performance numbers require use of offset and gain adjustements in software by TI-provided ADC drivers.

PARAMETER	TEST CONDITIONS	MIN TY	MAX	UNIT
Reference voltage	Fixed internal reference (input voltage scaling disabled). For best accuracy, the ADC conversion should be initiated through the TI-RTOS API in order to include the gain/offset compensation factors stored in FCFG1. This value is derived from the scaled value (4.3V) as follows: $V_{\text{ref}} = 4.3V \times 1408 / 4095$	1.4	3	٧
Reference voltage	VDDS as reference, input voltage scaling enabled	VDDS	3	V
Reference voltage	VDDS as reference, input voltage scaling disabled	VDDS 2.82 ⁽⁸		V
Input impedance	200 kSamples/s, voltage scaling enabled. Capacitive input, Input impedance depends on sampling frequency and sampling time	>	I	ΜΩ

- Using IEEE Std 1241-2010 for terminology and test methods.
- (2) Input signal scaled down internally before conversion, as if voltage range was 0V to 4.3V.
- (3) No missing codes.
- ADC_output = $\Sigma(4^n \text{ samples }) >> n$, n = desired extra bits. (4)
- Applied voltage must be within Absolute Maximum Ratings at all times.

7.16.4 RX Performance

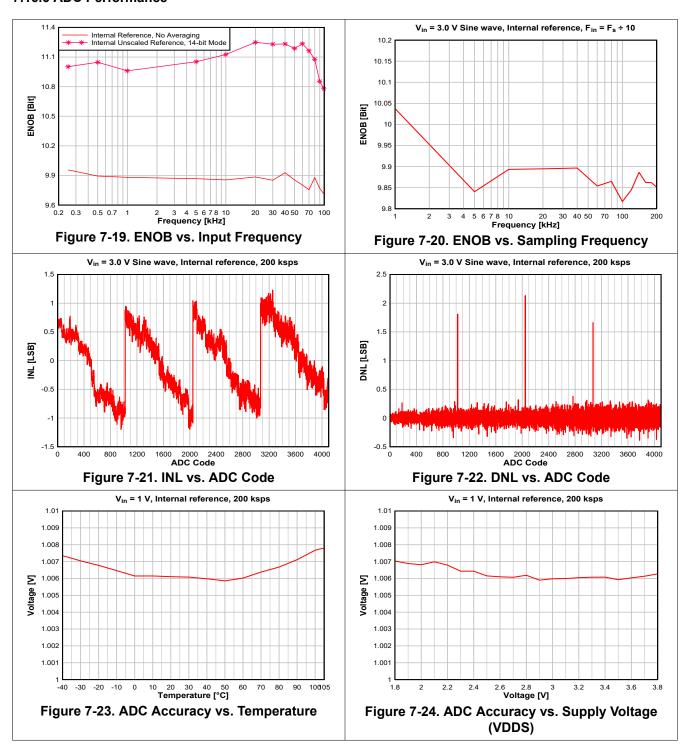

7.16.5 TX Performance

7.16.6 ADC Performance

8 Detailed Description

8.1 Overview

Figure 4-1 shows the core modules of the CC1314R10 device.

Throughout this section, see the Technical Reference Manual listed in Section 11.2 for more details.

8.2 System CPU

The CC1314R10 SimpleLink[™] Wireless MCU contains an Arm[®] Cortex[®]-M33 system CPU with TrustZone[®], which runs the application and the higher layers of radio protocol stacks.

The system CPU is the foundation of a high-performance, low-cost platform that meets the system requirements of minimal memory implementation, and low power consumption while delivering outstanding computational performance and exceptional system response to interrupts.

Its features include the following:

- ARMv8-M architecture with TrustZone[®] security extension optimized for small-footprint embedded applications
- Arm Thumb®-2 mixed 16- and 32-bit instruction set delivers the high performance expected of a 32-bit Arm
 core in a compact memory size
- · 8 regions of non-secure memory-protected regions
- 8 regions of secure memory-protected regions
- 4 regions of Security Attribute Unit (SAU)
- · Single-cycle multiply instruction and hardware divide
- Digital signal processing (DSP) extension
- IEEE 754-compliant single-precision Floating Point Unit (FPU)
- · Fast code execution permits increased sleep mode time
- Deterministic, high-performance interrupt handling for time-critical applications
- Full debug with data matching for watchpoint generation
 - Data Watchpoint and Trace Unit (DWT)
 - JTAG Debug Access Port (DAP)
 - Flash Patch and Breakpoint Unit (FPB)
- Trace support reduces the number of pins required for debugging and tracing
 - Instrumentation Trace Macrocell Unit (ITM)
 - Trace Port Interface Unit (TPIU) with asynchronous serial wire output (SWO)
- Optimized for single-cycle flash memory access
- Tightly connected to 8kB 4-way random replacement cache for minimal active power consumption and wait states
- Ultra-low-power consumption with integrated sleep modes
- · 48MHz operation

8.3 Radio (RF Core)

The RF Core is a highly flexible and future-proof radio module that contains an Arm Cortex-M0 processor that interfaces the analog RF and base-band circuitry, handles data to and from the system CPU side, and assembles the information bits in a given packet structure. The RF core offers a high-level, command-based API to the main CPU that configurations and data are passed through. The Arm Cortex-M0 processor is not programmable by customers and is interfaced through the TI-provided RF driver that is included with the SimpleLink Software Development Kit (SDK).

The RF core can autonomously handle the time-critical aspects of the radio protocols, thus offloading the main CPU, which reduces power and leaves more resources for the user application. Several signals are also available to control external circuitry such as RF switches or range extenders autonomously.

The various physical layer radio formats are partly built as a software-defined radio where the radio behavior is either defined by radio ROM contents or by non-ROM radio formats delivered in the form of firmware patches with the SimpleLink SDKs. This allows the radio platform to be updated for support of future versions of standards even with over-the-air (OTA) updates while still using the same silicon.

Note

Not all combinations of features, frequencies, data rates, and modulation formats described in this chapter are supported. Over time, TI can enable new physical radio formats (PHYs) for the device and provides performance numbers for selected PHYs in the data sheet. Supported radio formats for a specific device, including optimized settings to use with the TI RF driver, are included in the SmartRF Studio tool with performance numbers of selected formats found in Section 7.

8.3.1 Proprietary Radio Formats

The CC1314R10 radio can support a wide range of physical radio formats through a set of hardware peripherals combined with firmware available in the device ROM, covering various customer needs for optimizing parameters such as speed or sensitivity. This allows great flexibility in tuning the radio both to work with legacy protocols as well as customizing the behavior for specific application needs.

Table 8-1 gives a simplified overview of features of the various radio formats available in ROM. Other radio formats may be available in the form of radio firmware patches or programs through the software development kit (SDK) and may combine features in a different manner, as well as add other features.

Table 8-1. Feature Support

Feature	Main 2-(G)FSK Mode	High Data Rates	Low Data Rates	SimpleLink™ Long Range
Programmable preamble, sync word and CRC	Yes	Yes	Yes	No
Programmable receive bandwidth	Yes	Yes	Yes (down to 4 kHz)	Yes
Data / Symbol rate ⁽³⁾	20 to 1000kbps	≤ 2 Msps	≤ 100 ksps	≤ 20 ksps
Modulation format	2-(G)FSK	2-(G)FSK 4-(G)FSK	2-(G)FSK 4-(G)FSK	2-(G)FSK
Dual Sync Word	Yes	Yes	No	No
Carrier Sense (1) (2)	Yes	No	No	No
Preamble Detection ⁽²⁾	Yes	Yes	Yes	No
Data Whitening	Yes	Yes	Yes	Yes
Digital RSSI	Yes	Yes	Yes	Yes
CRC filtering	Yes	Yes	Yes	Yes
Direct-sequence spread spectrum (DSSS)	No	No	No	1:2 1:4 1:8
Forward error correction (FEC)	No	No	No	Yes
Link Quality Indicator (LQI)	Yes	Yes	Yes	Yes

⁽¹⁾ Carrier Sense can be used to implement HW-controlled listen-before-talk (LBT) and Clear Channel Assessment (CCA) for compliance with such requirements in regulatory standards. This is available through the CMD PROP CS radio API.

⁽²⁾ Carrier Sense and Preamble Detection can be used to implement sniff modes where the radio is duty-cycled to save power.

⁽³⁾ Data rates are only indicative. Data rates outside this range may also be supported. For some specific combinations of settings, a smaller range might be supported.

8.4 Memory

1024kB nonvolatile (Flash) memory provides storage for code and data in two banks. The flash memory is in-system programmable and erasable. The last flash memory sector must contain a Customer Configuration section (CCFG) that is used by boot ROM and TI-provided drivers to configure the device. This configuration is done through the ccfg.c source file that is included in all TI-provided examples.

The ultra-low leakage system static RAM (SRAM) is split into up to eight 32kB blocks and can be used for both storage of data and execution of code. Retention of SRAM contents in Standby power mode is enabled by default and included in Standby mode power consumption numbers. Parity checking for detection of bit errors in memory is built-in, which reduces chip-level soft errors and thereby increases reliability. Parity can be disabled for an additional 32kB that can be allocated for general-purpose SRAM. System SRAM is always initialized to zeroes upon code execution from boot.

To improve code execution speed and lower power when executing code from nonvolatile memory, a 4-way nonassociative 8kB cache is enabled by default to cache and prefetch instructions read by the system CPU. The cache can be used as a general-purpose RAM by enabling this feature in the Customer Configuration Area (CCFG).

There is a 4kB ultra-low leakage SRAM available for use with the Sensor Controller Engine which is typically used for storing Sensor Controller programs, data, and configuration parameters. This RAM is also accessible by the system CPU. The Sensor Controller RAM is not cleared to zeroes between system resets.

The ROM includes a TI-RTOS kernel and low-level drivers, as well as significant parts of selected radio stacks, which free up flash memory for the application. The ROM also contains a serial (SPI and UART) bootloader that can be used for the initial programming of the device.

8.5 Sensor Controller

The Sensor Controller contains circuitry that can be selectively enabled in both Standby and Active power modes. The peripherals in this domain can be controlled by the Sensor Controller Engine, which is a proprietary power-optimized CPU. This CPU can read and monitor sensors or perform other tasks autonomously; thereby significantly reducing power consumption and offloading the system CPU.

The Sensor Controller Engine is user-programmable with a simple programming language that has syntax similar to C. This programmability allows for sensor polling and other tasks to be specified as sequential algorithms rather than the static configuration of complex peripheral modules, timers, DMA, register programmable state machines, or event routing.

The main advantages are:

- Flexibility—Data can be read and processed in unlimited manners while still ensuring ultra-low power.
- 2MHz low-power mode enables the lowest possible handling of digital sensors
- Dynamic reuse of hardware resources
- · 40-bit accumulator supporting multiplication, addition, and shift
- · Observability and debugging options

Sensor Controller Studio is used to write, test, and debug code for the Sensor Controller. The tool produces C driver source code, which the System CPU application uses to control and exchange data with the Sensor Controller. Typical use cases may be (but are not limited to) the following:

- Read analog sensors using integrated ADC or comparators
- Interface digital sensors using GPIOs, SPI, UART, or I²C (UART and I²C are bit-banged)
- · Capacitive sensing
- · Waveform generation
- Very low-power pulse counting (flow metering)
- Key scan

The peripherals in the Sensor Controller include the following:

Submit Document Feedback

Copyright © 2024 Texas Instruments Incorporated

www.ti.com

- The low-power clocked comparator can be used to wake the system CPU from any state in which the comparator is active. A configurable internal reference DAC can be used in conjunction with the comparator. The output of the comparator can also be used to trigger an interrupt or the ADC.
- Capacitive sensing functionality is implemented through the use of a constant current source, a time-to-digital
 converter, and a comparator. The continuous time comparator in this block can also be used as a higheraccuracy alternative to the low-power clocked comparator. The Sensor Controller takes care of baseline
 tracking, hysteresis, filtering, and other related functions when these modules are used for capacitive
 sensing.
- The ADC is a 12-bit 200ksps ADC with eight inputs and a built-in voltage reference. The ADC can be triggered by many different sources including timers, I/O pins, software, and comparators.
- The analog modules can connect to up to eight different GPIOs.
- · Dedicated SPI master with up to 6MHz clock speed.

The peripherals in the Sensor Controller can also be controlled from the main application processor.

8.6 Cryptography

The CC1314R10 device comes with a wide set of modern cryptography-related hardware accelerators, drastically reducing code footprint and execution time for cryptographic operations. It also has the benefit of being lower power and improves availability and responsiveness of the system because the cryptography operations runs in a background hardware thread.

Together with a large selection of open-source cryptography libraries provided with the software development kit (SDK), this allows for secure and future proof IoT applications to be easily built on top of the platform. The hardware accelerator modules are:

- True Random Number Generator (TRNG) module provides a true, nondeterministic noise source for the
 purpose of generating keys, initialization vectors (IVs), and other random number requirements. The TRNG is
 built on 24 ring oscillators that create unpredictable output to feed a complex nonlinear-combinatorial circuit.
- Secure Hash Algorithm 2 (SHA-2) with support for SHA224, SHA256, SHA384, and SHA512.
- Advanced Encryption Standard (AES) with 128-bit, 192-bit, and 256-bit key lengths.
- Public Key Accelerator—Hardware accelerator supporting mathematical operations needed for elliptic curves up to 512 bits.

Through use of these modules and the TI provided cryptography drivers, the following capabilities are available for an application or stack:

Key Agreement Schemes

- Elliptic Curve Diffie—Hellman with static or ephemeral keys (ECDH and ECDHE)
- Elliptic curve Password Authenticated Key Exchange by Juggling (ECJ-PAKE)

Signature Processing

- Elliptic curve Diffie-Hellman Digital Signature Algorithm (ECDSA)
- Edwards-curve Digital Signature Algorithm (EdDSA)

Curve Support

- Short Weierstrass form, such as:
 - NIST-P224 (secp224r1), NIST-P256 (secp256r1), NIST-P384 (secp384r1), NIST-P521 (secp521r1)
 - Brainpool-256R1, Brainpool-384R1, Brainpool-512R1
- Montgomery form, such as:
 - Curve25519
- Twisted Edwards form, such as:
 - Ed25519

Message Authentication Codes

- AEC CBC-MAC
- AES CMAC
- HMAC with SHA224, SHA256, SHA384, and SHA512
- Block cipher mode of operation

· True random number generation

Other capabilities, such as RSA encryption and signatures (using keys as large as 2048 bits) as well as other ECC curves such as Curve1174, can be implemented using the provided public key accelerator but are not part of the TI SimpleLink SDK for the CC1314R10 device.

8.7 Timers

A large selection of timers are available as part of the CC1314R10 device. These timers are:

Real-Time Clock (RTC)

A 70-bit 3-channel timer running on the 32kHz low-frequency system clock (SCLK_LF). This timer is available in all power modes except Shutdown. The timer can be calibrated to compensate for frequency drift when using the LF RCOSC as the low-frequency system clock. If an external LF clock with a frequency different from 32.768kHz is used, the RTC tick speed can be adjusted to compensate for this. When using TI-RTOS, the RTC is used as the base timer in the operating system and should thus only be accessed through the kernel APIs such as the Clock module. The real-time clock can also be read by the Sensor Controller Engine to timestamp sensor data and also has dedicated capture channels. By default, the RTC halts when a debugger halts the device.

General Purpose Timers (GPTIMER)

The four flexible GPTIMERs can be used as either 4×32 -bit timers or 8×16 -bit timers, all running on up to 48MHz. Each of the 16- or 32-bit timers supports a wide range of features such as one-shot or periodic counting, pulse width modulation (PWM), time counting between edges, and edge counting. The inputs and outputs of the timer are connected to the device event fabric, which allows the timers to interact with signals such as GPIO inputs, other timers, DMA, and ADC. The GPTIMERs are available in Active and Idle power modes.

Sensor Controller Timers

The Sensor Controller contains three timers:

The Sensor Controller contains three timers: AUX Timers 0 and 1 are 16-bit timers with a 2^N prescaler. Timers can either increment on a clock or each edge of a selected tick source. Both one-shot and periodical timer modes are available.

AUX Timer 2 is a 16-bit timer that can operate at 24MHz, 2MHz, or 32kHz independent of the Sensor Controller functionality. There are four capture or compare channels, which can be operated in one-shot or periodical modes. The timer can be used to generate events for the Sensor Controller Engine or the ADC, as well as for PWM output or waveform generation.

Radio Timer

A multichannel 32-bit timer running at 4MHz is available as part of the device radio. The radio timer is typically used as the timing base in wireless network communication using the 32-bit timing word as the network time. The radio timer is synchronized with the RTC by using a dedicated radio API when the device radio is turned on or off. This ensures that for a network stack, the radio timer seems to always be running when the radio is enabled. The radio timer is in most cases used indirectly through the trigger time fields

Product Folder Links: CC1314R10

in the radio APIs and should only be used when running the accurate 48MHz high-frequency crystal is the source of SCLK_HF.

Watchdog Timer

The watchdog timer is used to regain control if the system operates incorrectly due to software errors. It is typically used to generate an interrupt and reset the device for the case where periodic monitoring of the system components and tasks fails to verify proper functionality. The watchdog timer runs on a 1.5MHz clock rate and cannot be stopped once enabled. The watchdog timer continues to run in Standby power mode but pauses when a debugger halts the device.

Always On Watchdog Timer (AON_WDT)

The Always On Watchdog Timer is used during standby to regain control when the system has failed due to a software error or failure of an external device to respond in the expected way. It generates a reset when its configured time-out counter reaches zero and cannot be stopped once started, unless by asserting a device reset. The Always-on watchdog timer runs in Standby power mode and may pause when a debugger halts the device.

8.8 Serial Peripherals and I/O

The SPI interface provides a standardized synchronous serial interface to communicate with devices compatible with SPI (3 and 4 wire), MICROWIRE and TI Synchronous Serial Format. The SPIs support master/slave operation up to 12MHz, programmable clock bit rate with prescaler, as well as configurable phase and polarity.

The UART interface implements universal asynchronous receiver and transmitter functions. The UART supports flexible baud-rate generation up to a maximum of 3Mbps with FIFO, multiple data sizes, stop, and parity bits as well as hardware handshake.

The I²S interface provides a standardized interface to exchange digital audio with devices compatible with this standard, including ADCs, DACs, and CODECs. The I²S can also receive pulse-density modulation (PDM) data from devices such as digital microphones and perform conversion to PCM data.

The I²C interface enables low-speed serial communications with devices compatible with the I²C standard. The I²C interface can handle both standard (100kHz) and fast (400kHz) speeds, as well as four modes of operation: master transmit/receive and slave transmit/receive.

The I/O controller (IOC) controls the digital I/O pins and contains multiplexer circuitry to allow a set of peripherals to be assigned to I/O pins in a flexible manner. All digital I/Os are interrupt and wake-up capable, have a programmable pullup and pulldown function, and can generate an interrupt on a negative or positive edge (configurable). When configured as an output, pins can function as either push-pull or open-drain. Five GPIOs have high-drive capabilities, which are marked in **bold** in Section 6. All digital peripherals can be connected to any digital pin on the device.

8.9 Battery and Temperature Monitor

A combined temperature and battery voltage monitor is available in the CC1314R10 device. The battery and temperature monitor allows an application to continuously monitor on-chip temperature and supply voltage and respond to changes in environmental conditions as needed. The module contains window comparators to interrupt the system CPU when temperature or supply voltage goes outside defined windows. These events can also be used to wake up the device from Standby mode through the always-on (AON) event fabric.

8.10 µDMA

The device includes a direct memory access (µDMA) controller. The µDMA controller provides a way to offload data-transfer tasks from the system CPU, thus allowing for more efficient use of the processor and the available bus bandwidth. The µDMA controller can perform a transfer between memory and peripherals. The µDMA controller has dedicated channels for each supported on-chip module and can be programmed to automatically perform transfers between peripherals and memory when the peripheral is ready to transfer more data.

Some features of the µDMA controller include the following (this is not an exhaustive list):

- Highly flexible and configurable channel operation of up to 32 channels
- Transfer modes: memory-to-memory, memory-to-peripheral, peripheral-to-memory, and peripheral-to-peripheral
- Data sizes of 8 bits, 16 bits, and 32 bits
- Ping-pong mode for continuous streaming of data

8.11 Debug

The debug subsystem implements two IEEE standards for debug and test purposes:

IEEE 1149.7 Class 4: Reduced-pin and Enhanced-functionality Test Access Port and Boundary-scan Architecture. This is known by the acronym cJTAG (compact JTAG) and this device uses only two pins to communicate with the target: TMS (JTAG TMSC) and TCK (JTAG TCKC). This is the default mode of operation.

IEEE standard 1149.1: Test Access Port and Boundary Scan Architecture Test Access Port (TAP). This standard is known by the acronym JTAG and this device uses four pins to communicate with the target: TMS (JTAG TMSC), TCK (JTAG TCKC), TDI (JTAG TDI), and TDO (JTAG TDO).

Product Folder Links: CC1314R10

The debug subsystem also implements a user-configurable firewall to control unauthorized access to debug/test ports.

Also featured is **EnergyTrace/EnergyTrace++**. This technology implements an improved method for measuring MCU current consumption, which features a very high dynamic range (from sub-µA to hundreds of mA), high sample rate (up to 256 kSamples/s), and the ability to track the CPU and peripheral power states.

Two modes of operation can be configured. **EnergyTrace** measures the overall MCU current consumption and allows maximum accuracy and speed to track ultra-low-power states as well as the fast power transitions during radio transmission and reception. **EnergyTrace++** tracks the various power states of both the CPU and its Peripherals as well as the system clocks, allowing close monitoring of the overall device activity.

8.12 Power Management

To minimize power consumption, the CC1314R10 supports a number of power modes and power management features (see Table 8-2).

MODE	SOFTV	VARE CONFIGURABLE I	POWER MODES		RESET PIN
MODE	ACTIVE	IDLE	STANDBY	SHUTDOWN	HELD
CPU	Active	Off	Off	Off	Off
Flash	On	Available	Off	Off	Off
SRAM	On	On	Retention	Off	Off
Supply System	On	On	Duty Cycled	Off	Off
Register and CPU retention	Full	Full	Partial	No	No
SRAM retention	Full	Full	Full	No	No
48MHz high-speed clock (SCLK_HF)	XOSC_HF or RCOSC_HF	XOSC_HF or RCOSC_HF	Off	Off	Off
2MHz medium-speed clock (SCLK_MF)	RCOSC_MF	RCOSC_MF	Available	Off	Off
32kHz low-speed clock (SCLK_LF)	XOSC_LF or RCOSC_LF	XOSC_LF or RCOSC_LF	XOSC_LF or RCOSC_LF	Off	Off
Peripherals	Available	Available	Off	Off	Off
Sensor Controller	Available	Available	Available	Off	Off
Wake-up on RTC	Available	Available	Available	Off	Off
Wake-up on pin edge	Available	Available	Available	Available	Off
Wake-up on reset pin	On	On	On	On	On
Brownout detector (BOD)	On	On	Duty Cycled	Off	Off
Power-on reset (POR)	On	On	On	Off	Off
Watchdog timer (WDT)	Available	Available	Paused	Off	Off
Always-on Watchdog timer (AON_WDT)	Available	Available	Available	Off	Off

Table 8-2. Power Modes

In **Active** mode, the application system CPU is actively executing code. Active mode provides normal operation of the processor and all of the peripherals that are currently enabled. The system clock can be any available clock source (see Table 8-2).

In **Idle** mode, all active peripherals can be clocked, but the Application CPU core and memory are not clocked and no code is executed. Any interrupt event brings the processor back into active mode.

In **Standby** mode, only the always-on (AON) domain is active. An external wake-up event, RTC event, or Sensor Controller event is required to bring the device back to active mode. MCU peripherals with retention do not need to be reconfigured when waking up again, and the CPU continues execution from where it went into standby mode. All GPIOs are latched in standby mode.

In **Shutdown** mode, the device is entirely turned off (including the AON domain and Sensor Controller), and the I/Os are latched with the value they had before entering shutdown mode. A change of state on any I/O pin defined as a *wake from shutdown pin* wakes up the device and functions as a reset trigger. The CPU can differentiate between reset in this way and reset-by-reset pin or power-on reset by reading the reset status register. The only state retained in this mode is the latched I/O state and the flash memory contents.

The Sensor Controller is an autonomous processor that can control the peripherals in the Sensor Controller independently of the system CPU. This means that the system CPU does not have to wake up, for example, to perform an ADC sampling or poll a digital sensor over SPI, thus saving both current and wake-up time that would otherwise be wasted. The Sensor Controller Studio tool enables the user to program the Sensor Controller, control its peripherals, and wake up the system CPU as needed. All Sensor Controller peripherals can also be controlled by the system CPU.

Note

The power, RF, and clock management for the CC1314R10 device require specific configuration and handling by software for optimized performance. This configuration and handling is implemented in the TI-provided drivers that are part of the CC1314R10 software development kit (SDK). Therefore, TI highly recommends using this software framework for all application development on the device. The complete SDK with TI-RTOS (optional), device drivers, and examples is offered free of charge in the source code.

8.13 Clock Systems

The CC1314R10 device has several internal system clocks.

The 48MHz SCLK_HF is used as the main system (MCU and peripherals) clock. This can be driven by the internal 48MHz RC Oscillator (RCOSC_HF) or an external 48MHz crystal (XOSC_HF). Radio operation requires an external 48MHz crystal.

SCLK_MF is an internal 2MHz clock that is used by the Sensor Controller in low-power mode and also for internal power management circuitry. The SCLK_MF clock is always driven by the internal 2MHz RC oscillator (RCOSC_MF).

SCLK_LF is the 32.768kHz internal low-frequency system clock. It can be used by the Sensor Controller for ultra-low-power operation and is also used for the RTC and to synchronize the radio timer before or after Standby power mode. SCLK_LF can be driven by the internal 32.8kHz RC Oscillator (RCOSC_LF), a 32.768kHz watch-type crystal, or a clock input on any digital IO.

When using a crystal or the internal RC oscillator, the device can output the 32kHz SCLK_LF signal to other devices, thereby reducing the overall system cost.

8.14 Network Processor

Depending on the product configuration, the CC1314R10 device can function as a wireless network processor (WNP), a device running the wireless protocol stack with the application running on a separate host MCU, or as a system-on-chip (SoC) with the application and protocol stack running on the system CPU inside the device.

In the first case, the external host MCU communicates with the device using SPI or UART. In the second case, the application must be written according to the application framework supplied with the wireless protocol stack.

9 Application, Implementation, and Layout

Note

Information in the following Applications section is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

For general design guidelines and hardware configuration guidelines, refer to CC13xx/CC26xx Hardware Configuration and PCB Design Considerations Application Report.

9.1 Reference Designs

The following reference designs should be followed closely when implementing designs using the CC1314R10 device.

Special attention must be paid to RF component placement, decoupling capacitors, and DC/DC regulator components, as well as ground connections for all of these.

CC1312-R7EM-XD7793 Design Files The CC1312-R7EM-XD7793 reference design provides schematic, layout, and production files for the characterization board used for deriving the performance number found in this document.

LP-EM-CC1314R10 Design Files

The CC1314R10 LaunchPad Design Files contain detailed schematics and layouts to build application-specific boards using the CC1314R10 device.

Sub-1 GHz and 2.4 GHz Antenna Kit for LaunchPad™ Development Kit and SensorTag The antenna kit allows real-life testing to identify the optimal antenna for your application. The antenna kit includes 16 antennas for frequencies from 169MHz to 2.4GHz, including:

- PCB antennas
- · Helical antennas
- · Chip antennas
- Dual-band antennas for 868MHz and 915MHz combined with 2.4GHz

The antenna kit includes a JSC cable to connect to the Wireless MCU LaunchPad Development Kits and SensorTags.

Submit Document Feedback

9.2 Junction Temperature Calculation

This section shows the different techniques for calculating the junction temperature under various operating conditions. For more details, see Semiconductor and IC Package Thermal Metrics.

There are three recommended ways to derive the junction temperature from other measured temperatures:

1. From package temperature:

$$T_I = \psi_{\rm IT} \times P + T_{\rm case} \tag{1}$$

2. From board temperature:

$$T_I = \psi_{\rm IB} \times P + T_{\rm board} \tag{2}$$

3. From ambient temperature:

$$T_I = R_{\theta IA} \times P + T_A \tag{3}$$

P is the power dissipated from the device and can be calculated by multiplying current consumption with supply voltage. Thermal resistance coefficients are found in Section 7.8.

For various application use cases, current consumption for other modules may have to be added to calculate the appropriate power dissipation. For example, the MCU may be running simultaneously as the radio, peripheral modules may be enabled, and so on. Typically, the easiest way to find the peak current consumption, and thus the peak power dissipation in the device, is to measure as described in Measuring CC13xx and CC26xx current consumption.

10 Device and Documentation Support

TI offers an extensive line of development tools. Tools and software to evaluate the performance of the device, generate code, and develop solutions are listed as follows.

10.1 Tools and Software

The CC1314R10 device is supported by a variety of software and hardware development tools.

Development Kit

CC1314R10 LaunchPad™ Development Kit

The CC1314R10 LaunchPad[™] Development Kit enables the development of high-performance Sub-1GHz wireless applications that benefit from low-power operation. The kit features the CC1314R10 Sub-1GHz SimpleLink[™] Wireless MCU. The kit works with the LaunchPad ecosystem, easily enabling additional functionality like sensors, displays, and more.

LP-XDS110 LaunchPad™ Debug Probe

The LP-XDS110 LaunchPad™ Debug Probe enables the development of high-performance wireless applications in the entire family of LP-EM LaunchPad™ development boards. Featuring a seamless connection with the new 20-pin LP-EM Debug connector, it supports not only multiple standards such as JTAG/cJTAG/SWD but also a UART backchannel for maximum debugging flexibility. It also features an Arm® 10-pin Debug connector to perform debugging on any custom board.

LP-XDS110ET LaunchPad™ Debug Probe

The LP-XDS110ET LaunchPad™ Debug Probe enables the development of high-performance wireless applications in the entire family of LP-EM LaunchPad™ development boards. Featuring a seamless connection with the new 20-pin LP-EM Debug connector, it supports not only multiple standards such as JTAG/cJTAG/SWD but also a UART backchannel for maximum debugging flexibility. In addition, it also features an Arm® 10-pin Debug connector to perform debugging on any custom board. This Debug Probe also features the XDS110 EnergyTrace™ technology, which is a new method for measuring the current consumption that captures the complete operational profile of the wireless MCU.

TMDSEMU110-U Debug Probe

The TMDSEMU110-U Debug Probe enables the development of high-performance wireless applications in the entire family of SimpleLink™ LaunchPad™ development boards. Featuring a convenient enclosure, which grants the proper mechanical robustness for field and production environments, it supports not only multiple standards such as JTAG/cJTAG/SWD but also a UART backchannel and four GPIOs for maximum debugging flexibility. In addition, the expansion connector allows using the TMDSEMU110-ETH addon (sold separately), which adds the full-featured XDS110 EnergyTrace™ technology with variable supply voltage from 1.8V to 3.6V and up to 800mA of supply current. The XDS110 EnergyTrace™ technology is a new method for measuring the current consumption that captures the complete operational profile of the wireless MCU.

Software

SimpleLink™ LOWPOWER F2 SDK

The SimpleLink™ LOWPOWER F2 Software Development Kit (SDK) provides a complete package for the development of wireless applications on the CC13XX / CC26XX family of devices. The SDK includes a comprehensive software package for the CC1314R10 device, including the following protocol stacks:

- Bluetooth Low Energy 4 and 5.3
- Thread (based on OpenThread)
- TI Z-Stack (Zigbee 3.0)

- TI 15.4-Stack—an IEEE 802.15.4-based star networking solution for Sub-1GHz and 2.4GHz
- EasyLink a large set of building blocks for building proprietary RF software stacks
- Multiprotocol support—concurrent operation between stacks using the Dynamic Multiprotocol Manager (DMM)
- TI Wi-SUN FAN Stack
- Matter

The SimpleLink™ LOWPOWER F2 SDK is part of TI's SimpleLink™ MCU platform, offering a single development environment that delivers flexible hardware, software, and tool options for customers developing wired and wireless applications. For more information about the SimpleLink™ MCU Platform, visit ti.com/simplelink.

Development Tools

Code Composer Studio™ Integrated Development Environment (IDE)

Code Composer Studio is an integrated development environment (IDE) that supports TI's Microcontroller and Embedded Processors portfolio. Code Composer Studio comprises a suite of tools used to develop and debug embedded applications. It includes an optimizing C/C++ compiler, source code editor, project build environment, debugger, profiler, and many other features. The intuitive IDE provides a single user interface taking you through each step of the application development flow. Familiar tools and interfaces allow users to get started faster than ever before. Code Composer Studio combines the advantages of the Eclipse® software framework with advanced embedded debug capabilities from TI resulting in a compelling feature-rich development environment for embedded developers.

CCS has support for all SimpleLink[™] Wireless MCUs and includes support for EnergyTrace[™] software (application energy usage profiling). A real-time object viewer plugin is available for TI-RTOS, part of the SimpleLink[™] SDK.

Code Composer Studio is provided free of charge when used in conjunction with the XDS debuggers included on a LaunchPad Development Kit.

Code Composer Studio™ Cloud IDE

Code Composer Studio (CCS) Cloud is a web-based IDE that allows you to create, edit, and build CCS and Energia[™] projects. After you have successfully built your project, you can download and run on your connected LaunchPad. Basic debugging, including features like setting breakpoints and viewing variable values, is now supported with CCS Cloud.

IAR Embedded Workbench® for Arm®

IAR Embedded Workbench® is a set of development tools for building and debugging embedded system applications using Assembler, C, and C++. It provides a completely integrated development environment that includes a project manager, editor, and build tools. IAR has support for all SimpleLink™ Wireless MCUs. It offers broad debugger support, including XDS110, IAR I-jet™, and Segger J-Link™. A real-time object viewer plugin is available for TI-RTOS, part of the SimpleLink™ SDK. IAR is also supported out-of-the-box on most software examples provided as part of the SimpleLink™ SDK.

A 30-day evaluation or a 32kB size-limited version is available through iar.com.

SmartRF™ Studio 7 SmartRF™ Studio 7 is a Windows® application that can be used to evaluate and configure SimpleLink™ Wireless MCUs from Texas Instruments. The application will help designers of RF systems to easily evaluate the radio at an early stage in the design process. It is especially useful for the generation of configuration register values and for practical testing and debugging of the RF system. SmartRF Studio can be used either as a standalone application or together with applicable evaluation boards or debug probes for the RF device. Features of the SmartRF Studio include:

· Link tests—send and receive packets between nodes

- · Antenna and radiation tests—set the radio in continuous wave TX and RX states
- Export radio configuration code for use with the TI SimpleLink™ SDK RF driver
- Custom GPIO configuration for signaling and control of external switches

Sensor Controller Studio

Sensor Controller Studio is used to write, test, and debug code for the Sensor Controller peripheral. The tool generates a Sensor Controller Interface driver, which is a set of C source files that are compiled into the System CPU application. These source files also contain the Sensor Controller binary image and allow the System CPU application to control and exchange data with the Sensor Controller. Features of the Sensor Controller Studio include:

- Ready-to-use examples for several common use cases
- Full toolchain with built-in compiler and assembler for programming in a C-like programming language
- · Provides rapid development by using the integrated sensor controller task testing and debugging functionality, including visualization of sensor data and verification of algorithms

UniFlash

UniFlash is a standalone tool used to program on-chip flash memory on TI MCUs. UniFlash has a GUI, command line, and scripting interface. UniFlash is available free of charge.

10.1.1 SimpleLink™ Microcontroller Platform

The SimpleLink™ microcontroller platform sets a new standard for developers with the broadest portfolio of wired and wireless Arm® MCUs (System-on-Chip) in a single software development environment. Delivering flexible hardware, software and tool options for your IoT applications. Invest once in the SimpleLink™ software development kit and use throughout your entire portfolio. Learn more on ti.com/simplelink.

10.2 Documentation Support

To receive notification of documentation updates on data sheets, errata, application notes and similar, navigate to the device product folder on ti.com/product/CC1314R10. In the upper right corner, click on Alert me to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

The current documentation that describes the MCU, related peripherals, and other technical collateral is listed as follows.

TI Resource Explorer

TI Resource Explorer Software examples, libraries, executables, and documentation are available for your device and development board.

Errata

CC1314R10 Silicon Errata

The silicon errata describes the known exceptions to the functional specifications for each silicon revision of the device and description on how to recognize a device revision.

Application Reports

All application reports for the CC1314R10 device are found on the device product folder at: ti.com/product/ CC1314R10/technicaldocuments.

Technical Reference Manual (TRM)

Technical Reference Manual

CC13x4, CC26x4 SimpleLink™ Wireless MCU The TRM provides detailed descriptions of all modules and peripherals available in the device family.

10.3 Support Resources

TI E2E[™] support forums are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

10.4 Trademarks

SimpleLink[™], LaunchPad[™], EnergyTrace[™], Code Composer Studio[™], and TI E2E[™] are trademarks of Texas Instruments.

I-jet[™] is a trademark of IAR Systems AB.

J-Link[™] is a trademark of SEGGER Microcontroller Systeme GmbH.

Arm[®], Cortex[®], and TrustZone[®] are registered trademarks of Arm Limited (or its subsidiaries) in the US and/or elsewhere.

CoreMark® is a registered trademark of Embedded Microprocessor Benchmark Consortium Corporation.

Arm Thumb® are registered trademarks of Arm Limited (or its subsidiaries).

is a registered trademark of Arm Limited (or its subsidiaries).

Wi-Fi® is a registered trademark of Wi-Fi Alliance.

Bluetooth® is a registered trademark of Bluetooth SIG Inc.

Zigbee® is a registered trademark of Zigbee Alliance Inc.

is a registered trademark of Arm Limited.

Eclipse® is a registered trademark of Eclipse Foundation.

IAR Embedded Workbench® is a registered trademark of IAR Systems AB.

Windows® is a registered trademark of Microsoft Corporation.

10.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

10.6 Glossary

TI Glossary

This glossary lists and explains terms, acronyms, and definitions.

11 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

	nanges from June 20, 2023 to April 30, 2024 (from Revision A (June 2023) to Revision B pril 2024))	ne.
•	Removed preliminary information footnote for RSK package	_
	Updated Device Comparison table	. ı
•	Updated Sensor controller power consumption in Section 7.5, Power Consumption - Power Modes	. J
	Updated Flash specifications in Section 7.7, Nonvolatile (Flash) Memory Characteristics	
	Removed redundant blocking and selectivity rows in both <i>Generic OOK (16.384kbps, OOK w / Manchester</i>	IJ
•	encoding, 100kHz RX BW) and 802.15.4, 50kbps, ±25kHz Deviation, 2-GFSK, 100kHz RX BW (Legacy) of Section 7.10, 861MHz to 1054MHz - Receive (RX)	13
•	Fixed typo in test conditions for Symbol Rate Tolerance in both 802.15.4-2020, 10kbps, 2-FSK, 26kHz RX BW, Mode #1a and 802.15.4-2020, 20kbps, 2-FSK, 52 kHz RX BW, Mode #1b of Section 7.10, 861MHz to	13
•	Fixed typo in test conditions for Frequency Error Tolerance (ppm) in 802.15.4, 50kbps, ±25kHz Deviation, 2-GFSK, 100kHz RX BW (Legacy) of Section 7.10, 861MHz to 1054MHz - Receive (RX)	
•	Merged parameter cells for Blocking -10MHz in WB-DSSS, 240/120/60/30kbps (480 ksym/s, 2-GFSK, ±195kHz Deviation, FEC (Half Rate), DSSS = 1/2/4/8, 622 kHz RX BW) of Section 7.10, 861MHz to	
	100 111112 11000110 (101)	13
•	Fixed incorrectly merged rows of test conditions for both Blocking +5% Fc. and Image rejection parameters i 802.15.4-2020, 10kbps, ±5kHz deviation, 2-FSK, 26kHz RX BW, Mode #1a of Section 7.10, 861MHz to 1054MHz - Receive (RX)	ın 13
•	Updated test conditions for Frequency Error Tolerance in section SimpleLink™ Long Range 2.5/5kbps (20 ksps), ±5kHz Deviation, 2-GFSK, 34 kHz RX Bandwidth, FEC = 1:2, DSSS = 1:4/1:2 of Section 7.10,	
	861MHz to 1054MHz - Receive (RX)1	٠.
•	Removed redundant Image Rejection row in 802.15.4, 50kbps, ±25kHz Deviation, 2-GFSK, 100kHz RX BW	
	(Legacy) of Section 7.10, 861MHz to 1054MHz - Receive (RX)	
•	Updated graphs and tables on Typical characteristics	
•	Added EnergyTrace information to Section 8.11, Debug5	54

12 Mechanical, Packaging, and Orderable Information 12.1 Packaging Information

The following pages include mechanical packaging and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

www.ti.com 18-Nov-2025

PACKAGING INFORMATION

Orderable part number	Status	Material type	Package Pins	Package qty Carrier	RoHS	Lead finish/ Ball material	MSL rating/ Peak reflow	Op temp (°C)	Part marking (6)
CC1314R106T0RGZR	Active	Production	VQFN (RGZ) 48	2500 LARGE T&R	Yes	NIPDAU	Level-3-260C-168 HR	-40 to 105	CC1314 R106
CC1314R106T0RGZR.B	Active	Production	VQFN (RGZ) 48	2500 LARGE T&R	Yes	NIPDAU	Level-3-260C-168 HR	-40 to 105	CC1314 R106
CC1314R106T0RSKR	Active	Production	VQFN (RSK) 64	2000 LARGE T&R	Yes	NIPDAU	Level-3-260C-168 HR	-40 to 105	CC1314 R106
CC1314R106T0RSKR.B	Active	Production	VQFN (RSK) 64	2000 LARGE T&R	Yes	NIPDAU	Level-3-260C-168 HR	-40 to 105	CC1314 R106

⁽¹⁾ Status: For more details on status, see our product life cycle.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

⁽²⁾ Material type: When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ RoHS values: Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

⁽⁴⁾ Lead finish/Ball material: Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ MSL rating/Peak reflow: The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ Part marking: There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

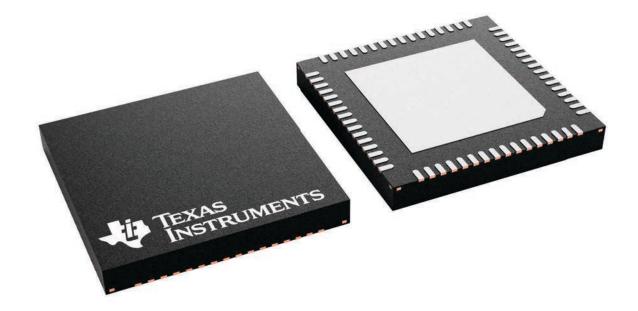

PACKAGE OPTION ADDENDUM

8 x 8, 0.4 mm pitch

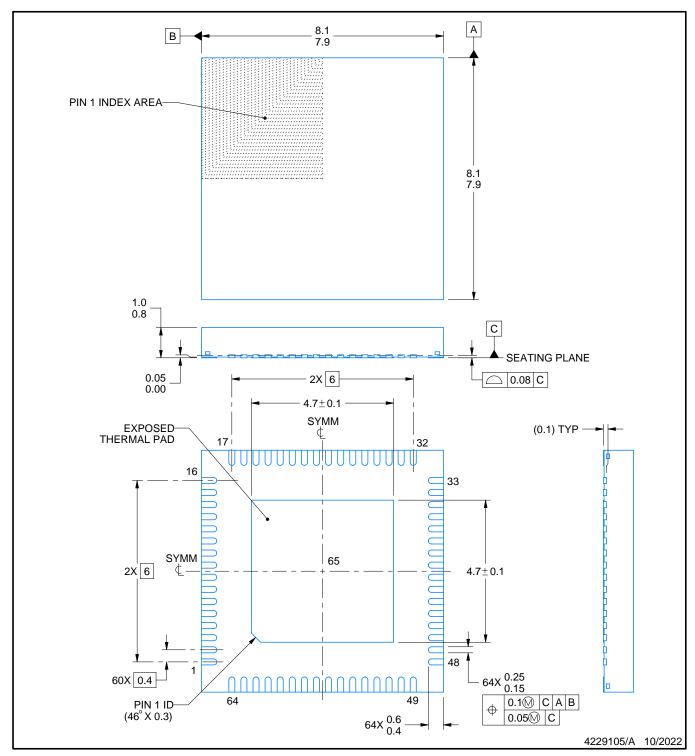

PLASTIC QUAD FLATPACK - NO LEAD

This image is a representation of the package family, actual package may vary. Refer to the product data sheet for package details.

PLASTIC QUAD FLATPACK - NO LEAD

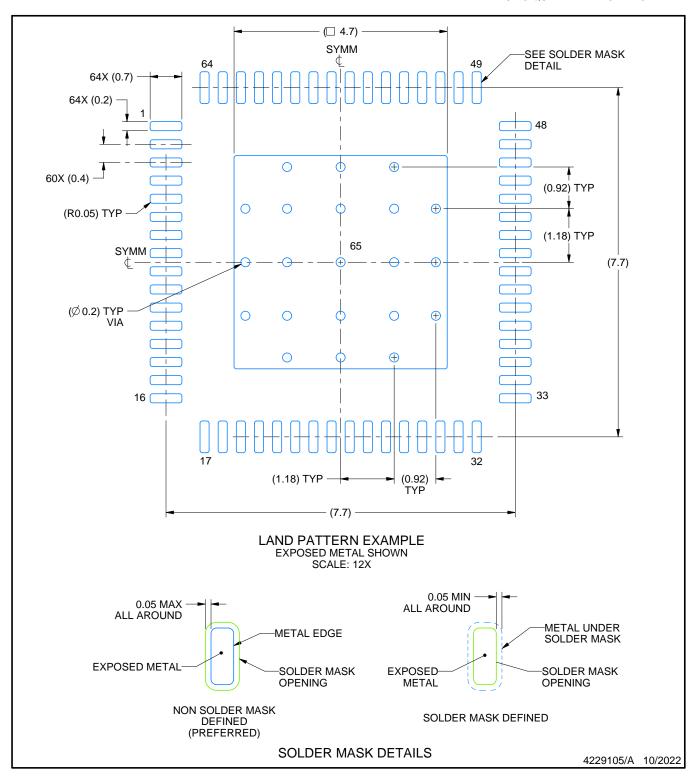

NOTES:

- 1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
 2. This drawing is subject to change without notice.
- 3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

PLASTIC QUAD FLATPACK - NO LEAD

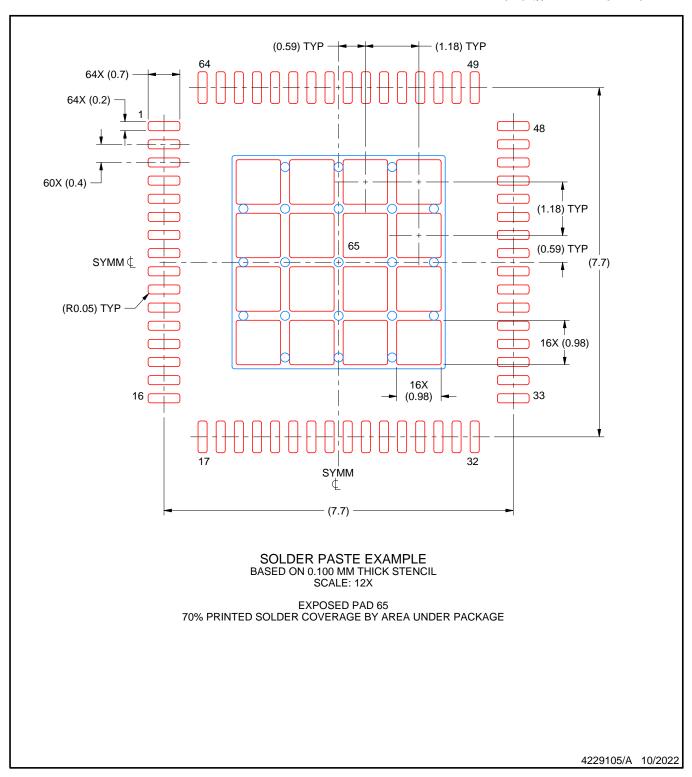

NOTES: (continued)

- 4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).
- 5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.

PLASTIC QUAD FLATPACK - NO LEAD

NOTES: (continued)

^{6.} Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
