

CDCLVP2108

SCAS878C -MAY 2009-REVISED JANUARY 2016

# CDCLVP2108 16-LVPECL Output, High-Performance Clock Buffer

#### 1 Features

- Dual 1:8 Differential Buffer
- Two Clock Inputs
- Universal Inputs Can Accept LVPECL, LVDS, LVCMOS/LVTTL
- 16 LVPECL Outputs
- · Maximum Clock Frequency: 2 GHz
- Maximum Core Current Consumption: 115 mA
- Very Low Additive Jitter: <100 fs, RMS in 10-kHz to 20-MHz Offset Range
- 2.375-V to 3.6-V Device Power Supply
- Maximum Propagation Delay: 550 ps
- Maximum Within Bank Output Skew: 25 ps
- LVPECL Reference Voltage, V<sub>AC\_REF</sub>, Available for Capacitive-Coupled Inputs
- Industrial Temperature Range: –40°C to +85°C
- Supports 105°C PCB Temperature (Measured with a Thermal Pad)
- Available in 7-mm x 7-mm, 48-Pin VQFN (RGZ) Package
- ESD Protection Exceeds 2000 V (HBM)

# 2 Applications

- Wireless Communications
- Telecommunications/Networking
- Medical Imaging
- Test and Measurement Equipment

# 3 Description

The CDCLVP2108 is a highly versatile, low additive jitter buffer that can generate 16 copies of LVPECL clock outputs from two LVPECL, LVDS, or LVCMOS inputs for a variety of communication applications. It has a maximum clock frequency up to 2 GHz. Each buffer block consists of one input that feeds two LVPECL outputs. The overall additive jitter performance is less than 0.1 ps, RMS from 10 kHz to 20 MHz, and overall output skew is as low as 25 ps, making the device a perfect choice for use in demanding applications.

The CDCLVP2108 clock buffer distributes two clock inputs (IN0, IN1) to 16 pairs of differential LVPECL clock outputs (OUT0, OUT15) with minimum skew for clock distribution. Each buffer block consists of one input that feeds two LVPECL clock outputs. The inputs can be LVPECL, LVDS, or LVCMOS/LVTTL.

The CDCLVP2108 is specifically designed for driving  $50-\Omega$  transmission lines. When driving the inputs in single-ended mode, the LVPECL bias voltage (V<sub>AC\_REF</sub>) must be applied to the unused negative input pin. However, for high-speed performance up to 2 GHz, differential mode is strongly recommended.

The CDCLVP2108 is characterized for operation from –40°C to +85°C and is available in a 7-mm × 7-mm, VQFN-48 package.

#### Device Information<sup>(1)</sup>

| PART NUMBER | PACKAGE   | BODY SIZE (NOM)   |
|-------------|-----------|-------------------|
| CDCLVP2108  | VQFN (48) | 7.00 mm × 7.00 mm |

(1) For all available packages, see the orderable addendum at the end of the data sheet.

# 6 Specifications

## 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

|                  |   | MIN  | MAX            | UNIT |
|------------------|---|------|----------------|------|
| V <sub>CC</sub>  | Supply voltage <sup>(2)</sup>               | -0.5 | 4.6            | V    |
| $V_{IN}$         | Input voltage (3)                           | -0.5 | $V_{CC} + 0.5$ | ٧    |
| $V_{OUT}$        | Output voltage <sup>(3)</sup>               | -0.5 | $V_{CC} + 0.5$ | V    |
| I <sub>IN</sub>  | Input current                               |      | 20             | mA   |
| I <sub>OUT</sub> | Output current                              |      | 50             | mA   |
| T <sub>A</sub>   | Specified free-air temperature (no airflow) | -40  | 85             | ů    |
| TJ               | Maximum junction temperature                |      | 125            | °C   |
| T <sub>stg</sub> | Storage temperature                         | -65  | 150            | ů    |

<sup>(1)</sup> Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) All supply voltages must be supplied simultaneously.

## 6.2 ESD Ratings

|                    |                         |  | VALUE | UNIT |
|--------------------|-------------------------|--|-------|------|
|                    |                         | Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 (1)                         | 2000  |      |
| V <sub>(ESD)</sub> | Electrostatic discharge | Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup> | 1000  | V    |

<sup>(1)</sup> JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

# 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

|                  |   | MIN   | NOM       | MAX  | UNIT |
|------------------|---|-------|-----------|------|------|
| $V_{CC}$         | Supply voltage                            | 2.375 | 2.50/3.30 | 3.60 | V    |
| T <sub>A</sub>   | Ambient temperature                       | -40   |           | 85   | °C   |
| T <sub>PCB</sub> | PCB temperature (measured at thermal pad) |       |           | 105  | °C   |

## 6.4 Thermal Information

See (1)(2)

|                              | THERMAL METRIC <sup>(3)</sup>                | CDCLVP2108<br>RGZ (VQFN)<br>48 PINS | UNIT |      |
|------------------------------|--|-------------------------------------|------|------|
| R <sub>0JA</sub>             | Junction-to-ambient thermal resistance       | 0 LFM                               | 30.8 | °C/W |
| $R_{\theta JC(top)}$         | Junction-to-case (top) thermal resistance    | T                                   | 18.2 | °C/W |
| $R_{\theta JB}$              | ` '  |                                     | 8.3  | °C/W |
| ΨЈТ                          | Junction-to-top characterization parameter   |                                     | 0.5  | °C/W |
| ΨЈВ                          | Junction-to-board characterization parameter |                                     | 8.3  | °C/W |
| R <sub>0JC(bot)</sub>        | Junction-to-case (bottom) thermal resistance |                                     | 3.8  | °C/W |
| $\theta_{JP}$ <sup>(4)</sup> | Thermal resistance, junction-to-pad          |                                     | 3.67 | °C/W |

<sup>(1)</sup> The package thermal resistance is calculated in accordance with JESD 51 and JEDEC 2S2P (high-K board).

Product Folder Links: CDCLVP2108

<sup>(3)</sup> The input and output negative voltage ratings may be exceeded if the input clamp-current and output clamp-current ratings are observed.

<sup>(2)</sup> JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

<sup>(2)</sup> Connected to GND with 16 thermal vias (0.3-mm diameter).

For more information about traditional and new thermal metrics, see the Semiconductor and IC Package Thermal Metrics application report (SPRA953).

<sup>(4)</sup> R<sub>0JP</sub> (junction-to-pad) is used for the VQFN package, because the primary heat flow is from the junction to the GND pad of the VQFN package.

# 6.5 Electrical Characteristics: LVCMOS Input, at $V_{CC}$ = 2.375 V to 3.6 V

at  $T_A = -40$ °C to +85°C and  $T_{PCB} \le 105$ °C (unless otherwise noted)<sup>(1)</sup>

# 8 Detailed Description

#### 8.1 Overview

The CDCLVP2108 is an open emitter for LVPECL outputs. Therefore, proper biasing and termination are required to ensure correct operation of the device and to minimize signal integrity. The proper termination for LVPECL outputs is a 50  $\Omega$  to ( $V_{CC}-2$ ) V, but this direct-coupled (DC) voltage is not readily available on PCB. Therefore, a Thevenin equivalent circuit is worked out for the LVPECL termination in both DC- and AC-coupled configurations. These configurations are shown in Figure 12 (a and b) for  $V_{CC}=2.5$  V and Figure 13 (a and b) for  $V_{CC}=3.3$  V, respectively. TI recommends placing all resistive components close to either the driver end or the receiver end. If the supply voltage for the driver and receiver is different, AC coupling is required.

## 8.2 Functional Block Diagram

#### 8.3 Feature Description

The CDCLVP2108 is a low additive jitter universal to LVPECL fan-out buffer with two independent inputs. The small package, low output skew, and low additive jitter make for a flexible device in demanding applications.

#### 8.4 Device Functional Modes

The two independent inputs of the CDCLVP2108 distribute the input clock to eight outputs each. Unused inputs and outputs can be left floating to reduce overall component cost. Both AC and DC coupling schemes can be used with the CDCLVP2108 to provide greater system flexibility.

#### 8.4.1 LVPECL Output Termination

The CDCLVP2108 is an open emitter for LVPECL outputs. Therefore, proper biasing and termination are required to ensure correct operation of the device and to minimize signal integrity. The proper termination for LVPECL outputs is 50  $\Omega$  to (V<sub>CC</sub> – 2) V, but this DC voltage is not readily available on PCB. Therefore, a Thevenin equivalent circuit is worked out for the LVPECL termination in both direct-coupled (DC) and AC-coupled configurations. These configurations are shown in Figure 12 a and b for V<sub>CC</sub> = 2.5 V and Figure 13 a and b for V<sub>CC</sub> = 3.3 V, respectively. TI recommends placing all resistive components close to either the driver end or the receiver end. If the supply voltage for the driver and receiver is different, AC coupling is required.

(b) Output AC Termination

Figure 12. LVPECL Output DC and AC Termination for  $V_{CC}$  = 2.5 V

Figure 13. LVPECL Output DC and AC Termination for  $V_{CC} = 3.3 \text{ V}$ 

# 8.4.2 Input Termination

The CDCLVP2108 inputs can be interfaced with LVPECL, LVDS, or LVCMOS drivers. Figure 14 shows how to DC-couple an LVCMOS input to the CDCLVP2108. The series resistance ( $R_{\rm S}$ ) must be placed close to the LVCMOS driver; its value is calculated as the difference between the transmission line impedance and the driver output impedance.

Figure 14. DC-Coupled LVCMOS Input to CDCLVP2108

Figure 15 shows how to DC-couple LVDS inputs to the CDCLVP2108. Figure 16 and Figure 17 describe the method of DC coupling LVPECL inputs to the CDCLVP2108 for  $V_{CC} = 2.5 \text{ V}$  and  $V_{CC} = 3.3 \text{ V}$ , respectively.

# 9 Application and Implementation

#### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

# 9.1 Application Information

The CDCLVP2108 is a low additive jitter LVPECL fan-out buffer that can generate two copies each of two independent LVPECL, LVDS, or LVCMOS inputs. The CDCLVP2108 can accept reference clock frequencies up to 2 GHz while providing low output skew.

# 9.2 Typical Application

Figure 20 shows a fan-out buffer for line-card application.

Figure 20. CDCLVP2108 Typical Application

#### 9.2.1 Design Requirements

The CDCLVP2108 shown in Figure 20 is configured to be able to select two inputs: a 156.25-MHz LVPECL clock from the backplane, or a secondary 156.25-MHz LVCMOS 2.5-V oscillator. Either signal can be then fanned out to desired devices, as shown.

The configuration example is driving 4 LVPECL receivers in a line-card application with the following properties:

- The PHY device has internal AC coupling and appropriate termination and biasing. The CDCLVP2108 must be provided with  $86-\Omega$  emitter resistors near the driver for proper operation.
- The ASIC is capable of DC coupling with a 2.5-V LVPECL driver such as the CDCLVP2108. This ASIC
  features internal termination so no additional components are needed.

Copyright © 2009–2016, Texas Instruments Incorporated

## **Typical Application (continued)**

The FPGA requires external AC coupling but has internal termination. Again, 86-Ω emitter resistors are
placed near the CDCLVP2108, and 0.1 μF are placed to provide AC coupling. Similarly, the CPU is internally
terminated and requires external AC coupling capacitors.

#### 9.2.2 Detailed Design Procedure

Refer to Input Termination for proper input terminations, dependent on single ended or differential inputs.

Refer to LVPECL Output Termination for output termination schemes depending on the receiver application.

Unused outputs can be left floating.

In Figure 20, the PHY, ASIC, and FPGA/CPU require different schemes. Power supply filtering and bypassing is critical for low-noise applications.

See <u>Power Supply Recommendations</u> for recommended filtering techniques. A reference layout is provided on the CDCLVP2108 Evaluation Module, <u>Low Additive Phase Noise Clock Buffer Evaluation Board User's Guide</u> (SCAU038).

# 9.2.3 Application Curves

The low additive noise of the CDCLVP2108 can be shown in this line-card application. The low noise 156.25 MHz XO with 32-fs, RMS jitter drives the CDCLVP2108, resulting in 57 fs, RMS when integrated from 10 kHz to 20 MHz. The resultant additive jitter is a low 47 fs, RMS for this configuration.

# 10 Power Supply Recommendations

## 10.1 Power-Supply Filtering

High-performance clock buffers are sensitive to noise on the power supply, which can dramatically increase the additive jitter of the buffer. Thus, it is essential to reduce noise from the system power supply, especially when jitter/phase noise is very critical to applications.

Filter capacitors are used to eliminate the low-frequency noise from the power supply, where the bypass capacitors provide the very low impedance path for high-frequency noise and guard the power-supply system against the induced fluctuations. These bypass capacitors also provide instantaneous current surges as required by the device and must have low equivalent series resistance (ESR). To properly use the bypass capacitors, they must be placed very close to the power-supply pins and laid out with short loops to minimize inductance. TI recommends adding as many high-frequency (for example, 0.1-µF) bypass capacitors as there are supply pins in the package. TI recommends, but does not require, inserting a ferrite bead between the board power supply and the chip power supply that isolates the high-frequency switching noises generated by the clock driver; these beads prevent the switching noise from leaking into the board supply. Choose an appropriate ferrite bead with very low DC resistance because it is imperative to provide adequate isolation between the board supply and the chip supply, as well as to maintain a voltage at the supply pins that is greater than the minimum voltage required for proper operation.

Figure 23 shows this recommended power-supply decoupling method.

Figure 23. Power-Supply Decoupling

# 11 Layout

## 11.1 Layout Guidelines

Power consumption of the CDCLVP2108 can be high enough to require attention to thermal management. For reliability and performance reasons, the die temperature must be limited to a maximum of 125°C. That is, as an estimate, ambient temperature  $(T_A)$  plus device power consumption times  $R_{\theta JA}$  must not exceed 125°C.

The device package has an exposed pad that provides the primary heat removal path to the printed circuit board (PCB). To maximize the heat dissipation from the package, a thermal landing pattern including multiple vias to a ground plane must be incorporated into the PCB within the footprint of the package. The exposed pad must be soldered down to ensure adequate heat conduction out of the package. Figure 24 shows a recommended land and via pattern.

# 11.2 Layout Example

Figure 24. Recommended PCB Layout

# 11.3 Thermal Considerations

The CDCLVP2108 supports high temperatures on the printed circuit board (PCB) measured at the thermal pad. The system designer must ensure that the maximum junction temperature is not exceeded.  $\Psi_{JB}$  can allow the system designer to measure the board temperature with a fine gauge thermocouple and back calculate the junction temperature using Equation 1. Note that  $\Psi_{JB}$  is close to  $R_{\theta JB}$  because 75 to 95% of the heat of a device is dissipated by the PCB. Further information can be found at SPRA953 and SLUA566.

$$T_{\text{junction}} = T_{\text{PCB}} + (\Psi_{\text{JB}} \times \text{Power}) \tag{1}$$

#### **Example:**

Calculation of the junction-lead temperature with a 4-layer JEDEC test board using four thermal vias:

 $T_{PCB} = 105$ °C

 $\Psi_{JB} = 8.3^{\circ}C/W$ 

Power<sub>inclTerm</sub> =  $I_{max} \times V_{max} = 677$  mA  $\times 3.6$  V = 2437 mW (maximum power consumption including termination resistors)

 $Power_{exclTerm} = 1833 \text{ mW}$  (maximum power consumption excluding termination resistors, see SLYT127 for further details)

 $\Delta T_{Junction} = \Psi_{JB} \times Power_{exclTerm} = 8.3^{\circ}C/W \times 1833 \text{ mW} = 15.21^{\circ}C$ 

 $T_{Junction} = \Delta T_{Junction} + T_{Chassis} = 15.21$ °C + 105°C = 120.21°C (the maximum junction temperature of 125°C is not violated)

<sup>(1)</sup> Status: For more details on status, see our product life cycle.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

<sup>(2)</sup> Material type: When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

<sup>(3)</sup> RoHS values: Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

<sup>(4)</sup> Lead finish/Ball material: Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

<sup>(5)</sup> MSL rating/Peak reflow: The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

<sup>(6)</sup> Part marking: There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.
