CSD86356Q5D Synchronous Buck NexFET™ Power Block

1 Features

- Half-Bridge Power Block
- 93.0% System Efficiency at 25 A
- Up to 40-A Operation
- High-Frequency Operation (Up to 1.5 MHz)
- High-Density SON 5-mm × 6-mm Footprint
- Optimized for 5-V Gate Drive
- Low-Switching Losses
- Ultra-Low Inductance Package
- RoHS Compliant
- Halogen Free
- Lead-Free Terminal Plating

2 Applications

- Synchronous Buck Converters
  - High-Frequency Applications
  - High-Current, Low Duty Cycle Applications
- Multiphase Synchronous Buck Converters
- POL DC-DC Converters
- IMVP, VRM, and VRD Applications

3 Description

The CSD86356Q5D NexFET™ power block is an optimized design for synchronous buck applications offering high-current, high-efficiency, and high-frequency capability in a small 5-mm × 6-mm outline. Optimized for 5-V gate drive applications, this product offers a flexible solution capable of offering a high-density power supply when paired with any 5-V gate drive from an external controller/driver.

5.1 Absolute Maximum Ratings

T_A = 25°C (unless otherwise noted)(1)

		MIN	MAX	UNIT
Voltage	V_{IN} to P_{GND}	–0.8	25	V
	V_{SW} to P_{GND}		25	
	V_{SW} to P_{GND} (10 ns)		27	
	T_G to T_{GR}	–8	10	
	B_G to P_{GND}	–8	10	
Pulsed current rating, IDM(2)			120	A
Power dissipation, P_D			12	W
Avalanche energy, E_{AS}	Sync FET, I_D = 88 A, L = 0.1 mH		387	mJ
	Control FET, I_D = 45 A, L = 0.1 mH		101	
T_J and T_{STG}	Operating junction and storage temperature	–55	150	°C

(1) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) Pulse duration = 50 µS. Duty cycle = 0.01.

5.2 Recommended Operating Conditions

T_A = 25°C (unless otherwise noted)

		MIN	MAX	UNIT
V_{GS}	Gate drive voltage	4.5	8	V
V_{IN}	Input supply voltage(1)		22	V
f_{SW}	Switching frequency C_{BST} = 0.1 µF (min)		1500	kHz
	Operating current		40	A
T_J	Operating temperature		125	°C
T_{STG}	Storage temperature		125	°C

(1) Operating at high V_{IN} can create excessive AC voltage overshoots on the switch node (V_{SW}) during MOSFET switching transients. For reliable operation, the switch node (V_{SW}) to ground voltage must remain at or below the *Absolute Maximum Ratings*.

5.3 Thermal Information

T_A = 25°C (unless otherwise noted)

THERMAL METRIC		MIN	MAX	UNIT
$R_{\theta JA}$	Junction-to-ambient thermal resistance (min Cu)(1)		125	°C/W
$R_{\theta JA}$	Junction-to-ambient thermal resistance (max Cu)(1) (2)		50	°C/W
$R_{\theta JC}$	Junction-to-case thermal resistance (top of package)(1)		12	°C/W
$R_{\theta JC}$	Junction-to-case thermal resistance (P_{GND} pin)(1)		1.8	°C/W

(1) $R_{\theta JC}$ is determined with the device mounted on a 1-in^2 (6.45-cm^2), 2-oz (0.071-mm) thick Cu pad on a 1.5-in × 1.5-in (3.81-cm × 3.81-cm), 0.06-in (1.52-mm) thick FR4 board. $R_{\theta JC}$ is specified by design while $R_{\theta JA}$ is determined by the user's board design.
(2) Device mounted on FR4 material with 1-in^2 (6.45-cm^2) Cu.

6 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

6.1 Application Information

The CSD86356Q5D NexFET power block is an optimized design for synchronous buck applications using 5-V gate drive. The control FET and sync FET silicon are parametrically tuned to yield the lowest power loss and highest system efficiency. As a result, a new rating method is needed which is tailored towards a more systems-centric environment. System-level performance curves such as power loss, Safe Operating Area (SOA), and normalized graphs allow engineers to predict the product performance in the actual application.

6.1.1 Equivalent System Performance

Many of today's high-performance computing systems require low-power consumption in an effort to reduce system operating temperatures and improve overall system efficiency. This has created a major emphasis on improving the conversion efficiency of today's synchronous buck topology. In particular, there has been an emphasis in improving the performance of the critical power semiconductor in the power stage of this application (see Figure 26). As such, optimization of the power semiconductors in these applications, needs to go beyond simply reducing $R_{DS(ON)}$.

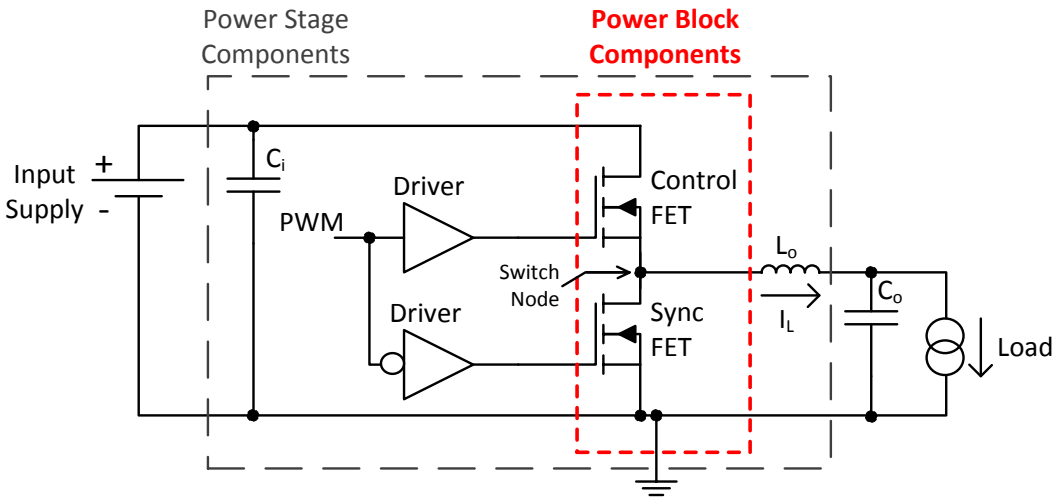

Figure 26. Synchronous Buck Topology

Application Information (continued)

The CSD86356Q5D is part of TI's power block product family which is a highly optimized product for use in a synchronous buck topology requiring high current, high efficiency, and high frequency. It incorporates TI's latest generation silicon which has been optimized for switching performance, as well as minimizing losses associated with Q_{GD}, Q_{GS}, and Q_{RR}. Furthermore, TI's patented packaging technology has minimized losses by nearly eliminating parasitic elements between the control FET and sync FET connections (see Figure 27). A key challenge solved by TI's patented packaging technology is the system-level impact of Common Source Inductance (CSI). CSI greatly impedes the switching characteristics of any MOSFET which in turn increases switching losses and reduces system efficiency. As a result, the effects of CSI need to be considered during the MOSFET selection process. In addition, standard MOSFET switching loss equations used to predict system efficiency need to be modified in order to account for the effects of CSI. Further details behind the effects of CSI and modification of switching loss equations are outlined in TI's Application Note *Power Loss Calculation With Common Source Inductance Consideration for Synchronous Buck Converters* (SLPA009).

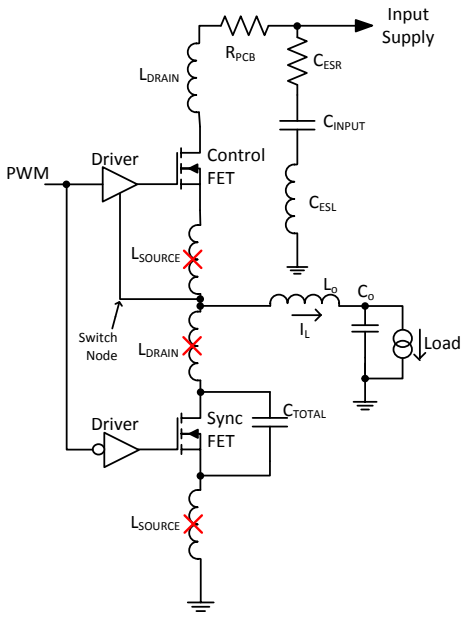

Figure 27. Elimination of Common Source Inductance

The combination of TI's latest generation silicon and optimized packaging technology has created a benchmarking solution that outperforms industry standard MOSFET chipsets of similar $R_{DS(ON)}$ and MOSFET chipsets with lower $R_{DS(ON)}$. Figure 28 and Figure 29 compare the efficiency and power loss performance of the CSD86356Q5D versus industry standard MOSFET chipsets commonly used in this type of application. This comparison purely focuses on the efficiency and generated loss of the power semiconductors only. The performance of CSD86356Q5D clearly highlights the importance of considering the Effective AC On-Impedance ($Z_{DS(ON)}$) during the MOSFET selection process of any new design. Simply normalizing to traditional MOSFET $R_{DS(ON)}$ specifications is not an indicator of the actual in-circuit performance when using TI's Power Block technology.

Figure 29. Power Loss

Comparison of $R_{DS(ON)}$ vs $Z_{DS(ON)}$ compares the traditional DC measured $R_{DS(ON)}$ of CSD86356Q5D versus its $Z_{DS(ON)}$. This comparison takes into account the improved efficiency associated with TI's patented packaging technology. As such, when comparing TI's Power Block products to individually packaged discrete MOSFETs or dual MOSFETs in a standard package, the in-circuit switching performance of the solution must be considered. In this example, individually packaged discrete MOSFETs or dual MOSFETs in a standard package would need to have DC measured $R_{DS(ON)}$ values that are equivalent to CSD86356Q5D's $Z_{DS(ON)}$ value in order to have the same efficiency performance at full load. Mid to light-load efficiency will still be lower with individually packaged discrete MOSFETs or dual MOSFETs in a standard package.

6.1.1.1 Comparison of $R_{DS(ON)}$ vs $Z_{DS(ON)}$

PARAMETER	HS		LS		UNIT
	TYP	MAX	TYP	MAX	
Effective AC on-impedance $Z_{DS(ON)}$ (V_{GS} = 5 V)	4.5	—	0.8	—	mΩ
DC measured $R_{DS(ON)}$ (V_{GS} = 4.5 V)	4.5	5.6	1.8	2.2	mΩ

6.1.2 Power Loss Curves

MOSFET centric parameters such as $R_{DS(ON)}$ and Q_{gd} are needed to estimate the loss generated by the devices. In an effort to simplify the design process for engineers, Texas Instruments has provided measured power loss performance curves. Figure 1 plots the power loss of the CSD86356Q5D as a function of load current. This curve is measured by configuring and running the CSD86356Q5D as it would be in the final application (see Figure 30).The measured power loss is the CSD86356Q5D loss and consists of both input conversion loss and gate drive loss. Equation 1 is used to generate the power loss curve.

$$(V_{IN} \times I_{IN}) + (V_{DD} \times I_{DD}) - (V_{SW\_AVG} \times I_{OUT}) = \text{Power loss} \quad (1)$$

The power loss curve in Figure 1 is measured at the maximum recommended junction temperatures of 125°C under isothermal test conditions.

6.1.3 Safe Operating Area (SOA) Curves

The SOA curves in the CSD86356Q5D data sheet provides guidance on the temperature boundaries within an operating system by incorporating the thermal resistance and system power loss. to Figure 3 outline the temperature and airflow conditions required for a given load current. The area under the curve dictates the safe operating area. All the curves are based on measurements made on a PCB design with dimensions of 4 in (W) × 3.5 in (L) × 0.062 in (T) and 6 copper layers of 1-oz copper thickness.

6.1.4 Normalized Curves

The normalized curves in the CSD86356Q5D data sheet provides guidance on the power loss and SOA adjustments based on their application specific needs. These curves show how the power loss and SOA boundaries will adjust for a given set of system conditions. The primary Y-axis is the normalized change in power loss and the secondary Y-axis is the change in system temperature required in order to comply with the SOA curve. The change in power loss is a multiplier for the power loss curve and the change in temperature is subtracted from the SOA curve.

6.2 Typical Application

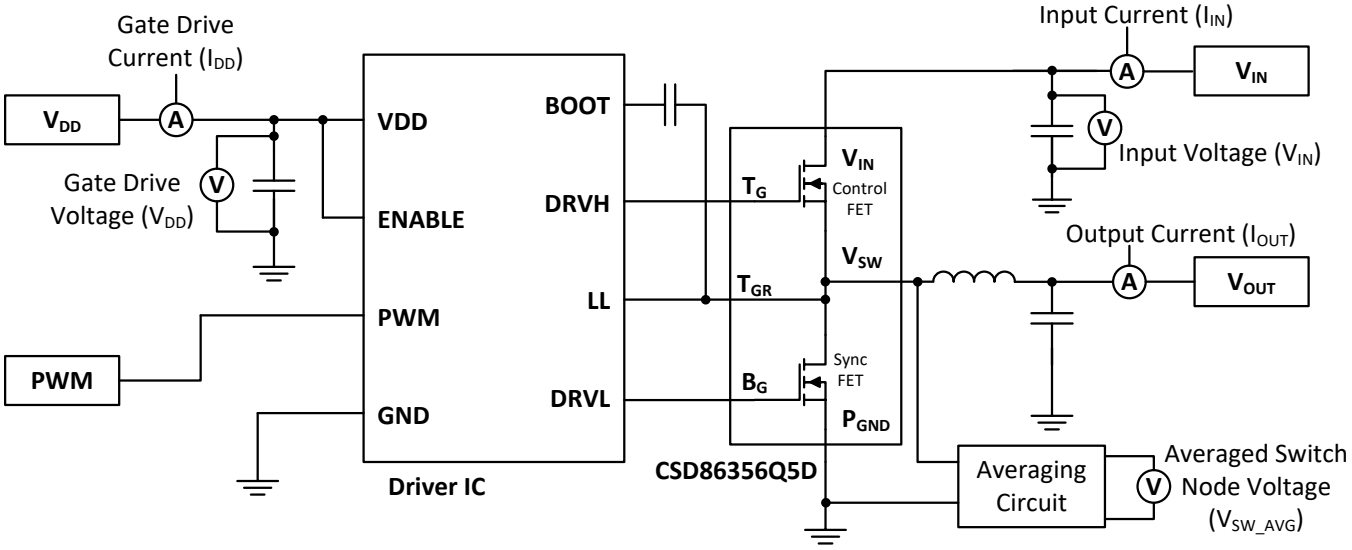

Figure 30. Typical Application

Typical Application (continued)

6.2.1 Design Example: Calculating Power Loss and SOA

The user can estimate product loss and SOA boundaries by arithmetic means (see *Operating Conditions*). Though the power loss and SOA curves in this data sheet are taken for a specific set of test conditions, the following procedure will outline the steps the user should take to predict product performance for any set of system conditions.

6.2.2 Operating Conditions

- Output current = 35 A
- Input voltage = 5 V
- Output voltage = 2 V
- Switching frequency = 950 kHz
- Inductor = 0.3 µH

6.2.2.1 Calculating Power Loss

- Power loss at 35 A = 5.57 W (Figure 1)
- Normalized power loss for input voltage ≈ 1.12 (Figure 5)
- Normalized power loss for output voltage ≈ 1.13 (Figure 6)
- Normalized power loss for switching frequency ≈ 1.21 (Figure 4)
- Normalized power loss for output inductor ≈ 1 (Figure 7)
- **Final calculated power loss = 5.57 W × 1.12 × 1.13 × 1.21 × 1 ≈ 8.5 W**

6.2.2.2 Calculating SOA Adjustments

- SOA adjustment for input voltage ≈ 1.37°C (Figure 5)
- SOA adjustment for output voltage ≈ 1.48°C (Figure 6)
- SOA adjustment for switching frequency ≈ 2.34°C (Figure 4)
- SOA adjustment for output inductor ≈ 0.03°C (Figure 7)
- **Final calculated SOA adjustment = 1.37 + 1.48 + 2.34 + 0.03 ≈ 5.2°C**

In the previous design example, the estimated power loss of the CSD58915Q5D would increase to 8.5 W. In addition, the maximum allowable board and/or ambient temperature would have to decrease by 5.2°C. Figure 31 graphically shows how the SOA curve would be adjusted accordingly.

1. Start by drawing a horizontal line from the application current to the SOA curve.
2. Draw a vertical line from the SOA curve intercept down to the board/ambient temperature.
3. Adjust the SOA board/ambient temperature by subtracting the temperature adjustment value.

Typical Application (continued)

In the design example, the SOA temperature adjustment yields a reduction in allowable board/ambient temperature of 5.2°C. In the event the adjustment value is a negative number, subtracting the negative number would yield an increase in allowable board/ambient temperature.

7 Layout

7.1 Recommended Schematic Overview

There are several critical components that must be used in conjunction with this power block device. Figure 32 shows a portion of a schematic with the critical components needed for proper operation.

- C22: Bypass capacitor for V_{IN} to help with ringing reduction (recommend 3.3-nF, 0402, 50-V ceramic capacitor)
- C20: Bootstrap capacitor
- C21: Bypass capacitor for V_{DD}
- C7-C14: Bypass capacitors for V_{IN} (minimum of 40 µF)
- C15: Electrolytic capacitor for V_{IN}
- R14, R16: Place holder for gate resistor (optional)
- R15: Place holder for bootstrap resistor (optional)
- R17, C16: Place holder for snubber (optional)

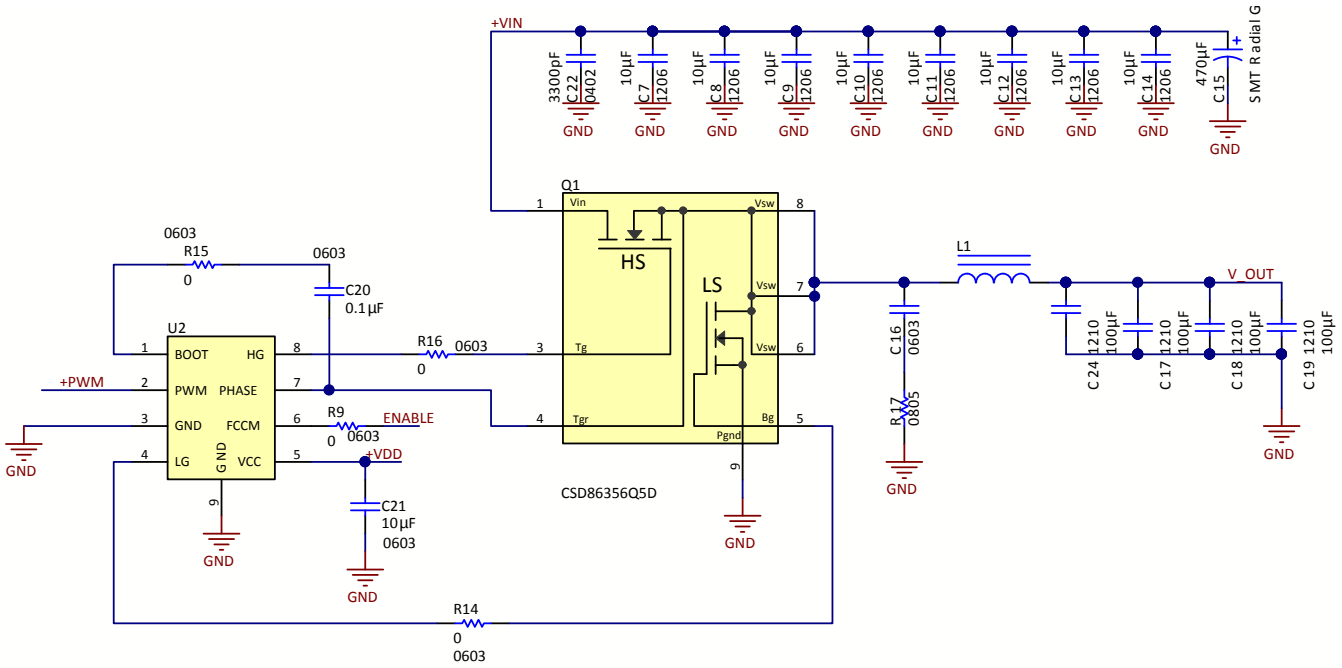

Figure 32. Recommended Schematic

7.2 Recommended PCB Design Overview

There are two key system-level parameters that can be addressed with a proper PCB design: electrical and thermal performance. Properly optimizing the PCB layout yields maximum performance in both areas. A brief description on how to address each parameter follows.

7.2.1 Electrical Performance

The power block has the ability to switch at voltage rates greater than 10 kV/μs. Special care must be taken with the PCB layout design and placement of the input capacitors, inductor, driver IC and output capacitors.

- The placement of the input capacitors relative to the power block's VIN and PGND pins should have the highest priority during the component placement routine. It is critical to minimize these node lengths. As such, ceramic input capacitors need to be placed as close as possible to the VIN and PGND pins (see Figure 33 and Figure 34). It is recommended that one 3.3-nF (or similar), 0402, 50-V ceramic capacitor be placed on the top side of the board as close as possible to VIN and PGND pins. In addition, a minimum of 40 μF of bulk ceramic capacitance should be placed as close as possible to the power block in a design. For high-density design, some of these ceramic capacitors can be placed on the bottom layer of PCB with appropriate number of vias interconnecting both layers.
- The driver IC should be placed relatively close to the power block gate pins. T_G and B_G should connect to the outputs of the driver IC. The T_{GR} pin serves as the return path of the high-side gate drive circuitry and should be connected to the phase pin of the IC (sometimes called LX, LL, SW, PH, etc.). The bootstrap capacitor for the driver IC will also connect to this pin.
- The switching node of the output inductor should be placed relatively close to the power block VSW pins. Minimizing the node length between these two components will reduce the PCB conduction losses and actually reduce the switching noise level. In the event the switch node waveform exhibits ringing that reaches undesirable levels, the use of a boost resistor or RC snubber can be an effective way to easily reduce the peak ring level. The recommended boost resistor value will range between 1.0 Ω to 4.7 Ω depending on the output characteristics of driver IC used in conjunction with the power block. The RC snubber values can range from 0.5 Ω to 2.2 Ω for the R and 330 pF to 2200 pF for the C. Please refer to *Snubber Circuits: Theory, Design and Application* (SLUP100) for more details on how to properly tune the RC snubber values. The RC snubber should be placed as close as possible to the VSW node and PGND (see Figure 33 and Figure 34). (1)

Recommended PCB Design Overview (continued)

7.2.2 Thermal Performance

The power block has the ability to utilize the GND planes as the primary thermal path. As such, the use of thermal vias is an effective way to pull away heat from the device and into the system board. Concerns of solder voids and manufacturability problems can be addressed by the use of three basic tactics to minimize the amount of solder attach that will wick down the via barrel:

- Intentionally space out the vias from each other to avoid a cluster of holes in a given area.
- Use the smallest drill size allowed in your design. The examples in Figure 33 and Figure 34 use vias with a 10-mil drill hole and a 16-mil capture pad.
- Tent the opposite side of the via with solder-mask.

In the end, the number and drill size of the thermal vias should align with the end user's PCB design rules and manufacturing capabilities.

8.3 Trademarks

NexFET, E2E are trademarks of Texas Instruments.
All other trademarks are the property of their respective owners.

8.4 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

8.5 Glossary

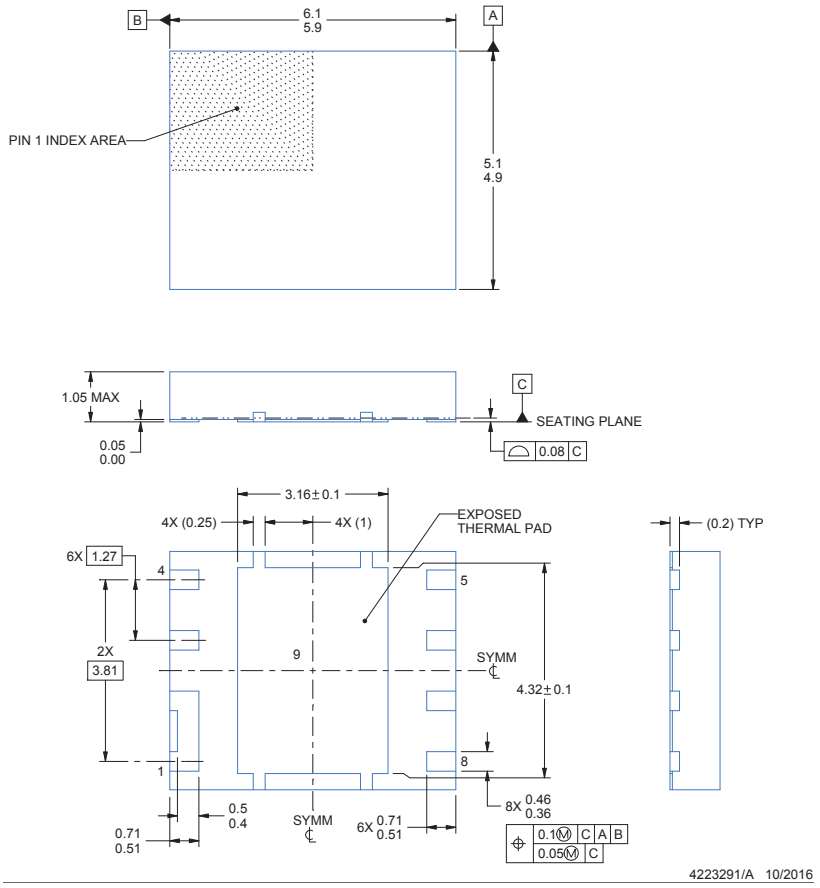
SLYZ022 — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

9 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

9.1 Q5D Package Dimensions

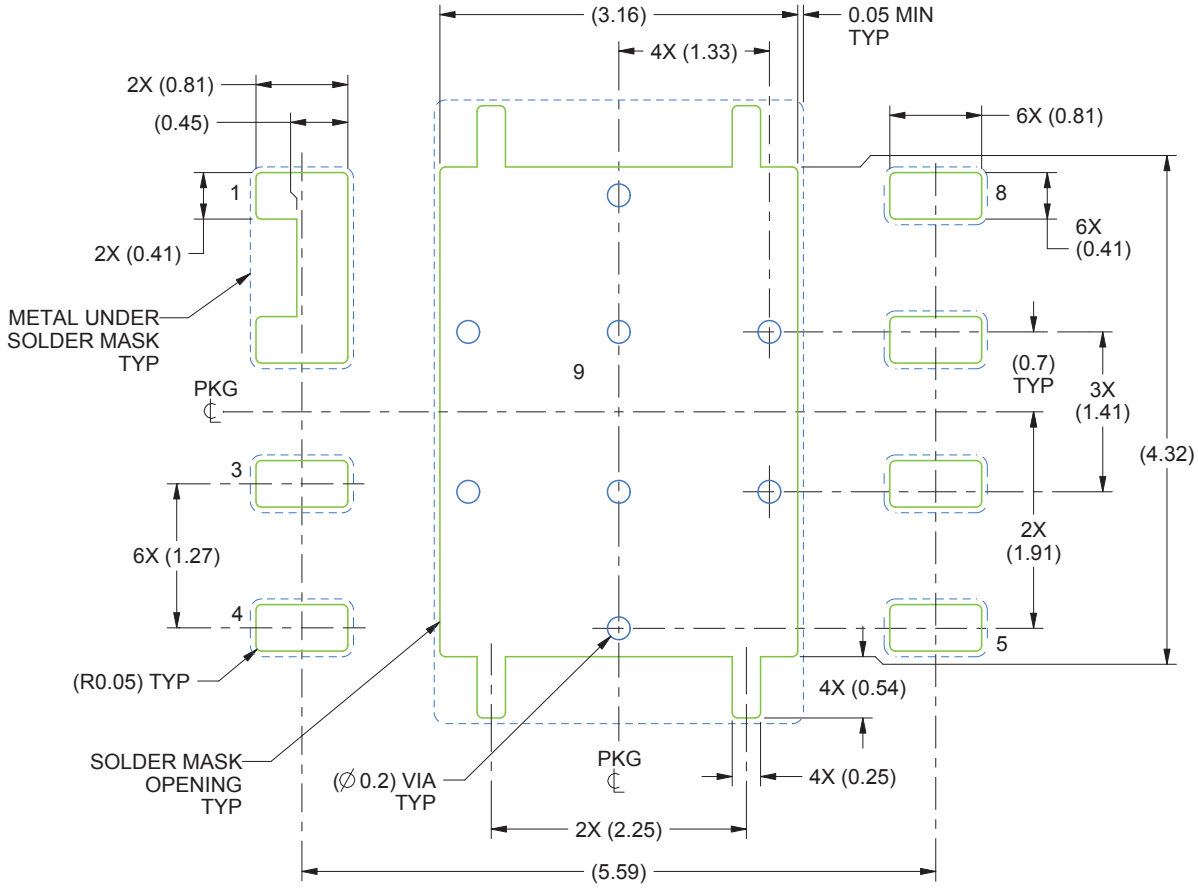


1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for optimal thermal and mechanical performance.

9.2 Pin Configuration

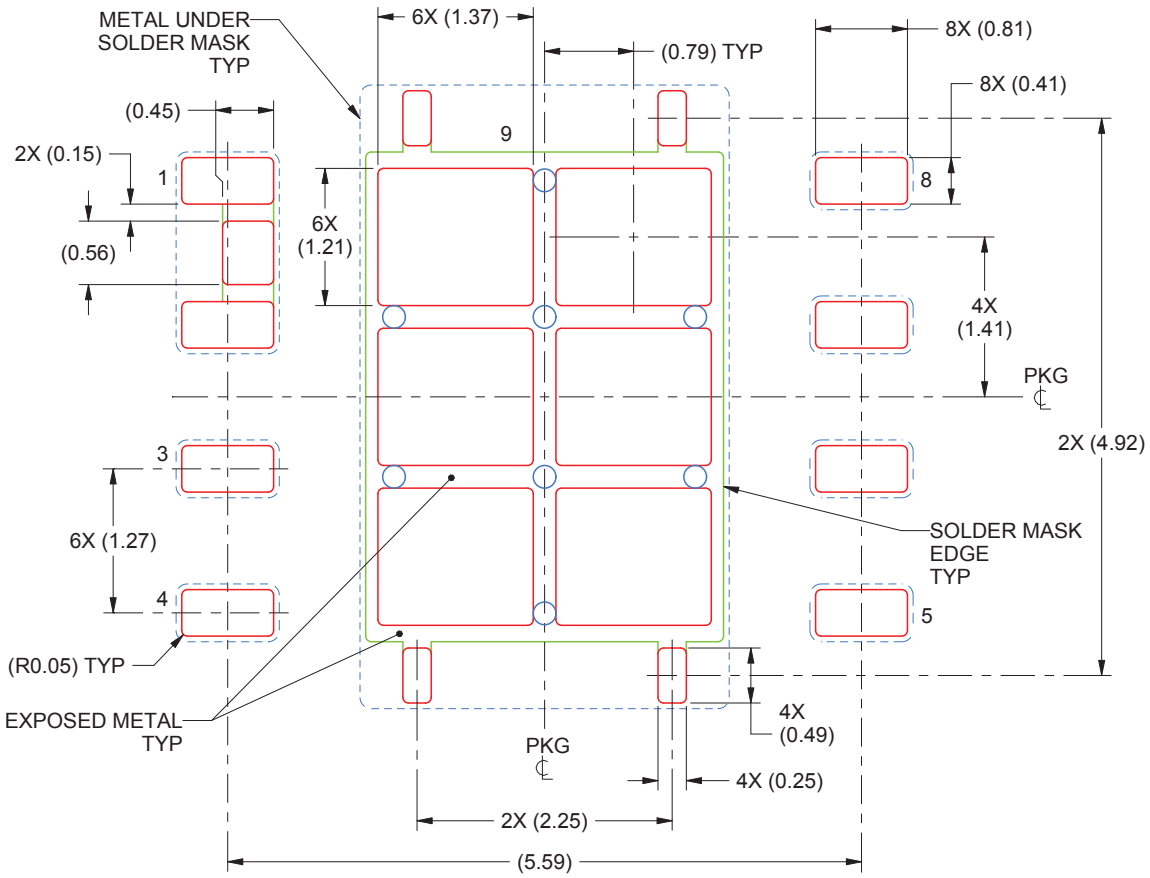
POSITION	DESIGNATION
Pin 1	V_{IN}
Pin 2	V_{IN}
Pin 3	T_G
Pin 4	T_{GR}
Pin 5	B_G
Pin 6	V_{SW}
Pin 7	V_{SW}
Pin 8	V_{SW}
Pin 9	P_{GND}

9.3 Land Pattern Recommendation



1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This package is designed to be soldered to a thermal pad on the board. For more information, see *QFN/SON PCB Attachment Application Report* (SLUA271).
3. Vias are optional depending on application, refer to device data sheet. If some or all are implemented, recommended via locations are shown.

9.4 Stencil Recommendation



1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

PACKAGING INFORMATION

(1) **Status:** For more details on status, see our product life cycle.

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

TAPE AND REEL INFORMATION
