

DS90UB635-Q1 SNLS707 - FEBRUARY 2023

DS90UB635-Q1 FPD-Link III 4.16-Gbps Serializer With CSI-2 Interface for 2.3MP/60fps Cameras, RADAR, and Other Sensors

1 Features

- AEC-Q100 qualified for automotive applications:
 - Device temperature grade 2: –40°C to +105°C ambient operating temperature range
- ISO 10605 and IEC 61000-4-2 ESD compliant
- Power-over-Coax (PoC) compatible transceiver
- 4.16-Gbps grade serializer supports high-speed sensors including full HD 1080p 2.3MP 60-fps and 4MP 30-fps imagers
- D-PHY v1.2 and CSI-2 v1.3 compliant system interface
 - Up to 4 data lanes at 600 Mbps 832 Mbps/
 - Supports up to four virtual channels
- Precision multi-camera clocking and synchronization
- Flexible programmable output clock generator
- Advanced data protection and diagnostics including CRC data protection, sensor data integrity check, I2C write protection, voltage and temperature measurement, programmable alarm, BIST, pattern generation, and line fault detection
- Supports single-ended coaxial or Shielded Twist-Pair (STP) cable
- Ultra-low latency bidirectional I2C and GPIO control channel enables ISP control from ECU
- Single 1.8 V power supply
- Low (0.28 W typical) power consumption
- Ultra-low latency bidirectional I2C and GPIO control channel enables ISP control from ECU
- Unique DIE-ID for counterfeit protection
- Compatible with the DS90UB638-Q1 deserializer and the DS90UB662-Q1 Hub
- Small 5-mm × 5-mm VQFN package and PoC solution size for compact camera module designs

2 Applications

- Advanced driver assistance systems (ADAS)
 - Surround View Systems (SVS)
 - Camera Monitor Systems (CMS)
 - Forward Vision Cameras (FC)
 - Driver Monitoring Systems (DMS)
 - Rear-View Cameras (RVC)
 - Time of Flight (ToF) Sensor Modules
 - Side Mirror Displays (SMD)
 - Automotive Satellite RADAR Modules
- Security and Surveillance
- Industrial and Medical Imaging

3 Description

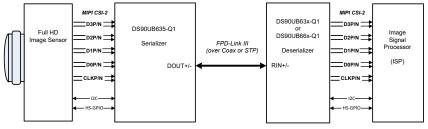

The DS90UB635-Q1 serializer is part of TI's FPD-Link III device family designed to support high-speed raw data sensors including 2.3MP imagers at 60fps and as well as 4MP, 30-fps cameras, satellite RADAR, LIDAR, and Time-of-Flight (ToF) sensors. The chip delivers a 4.16-Gbps forward channel and an ultra-low latency, 50-Mbps bidirectional control channel and supports power over a single coax (PoC) or STP cable. The DS90UB635-Q1 features advanced data protection and diagnostic features to support ADAS and autonomous driving. Together with a companion deserializer, the DS90UB635-Q1 delivers precise multi-camera sensor clock and sensor synchronization.

The DS90UB635-Q1 is fully AEC-Q100 qualified with a -40°C to 105°C wide temperature range. The serializer comes in a small 5-mm × 5-mm VQFN package for space-constrained sensor applications.

Device Information

| PART NUMBER | PACKAGE (1) | BODY SIZE (NOM) |
|--------------|-------------|-------------------|
| DS90UB635-Q1 | VQFN (32) | 5.00 mm × 5.00 mm |

For all available packages, see the orderable addendum at the end of the data sheet.

| CSI_D3N | 30 | I, DPHY | | | | | |

Table 5-1. Pin Functions (continued)

| | | | Table 5-1. Pin Functions (continued) |
|--------------------|-------------|---------|--|
| PIN | 1 | I/O | DESCRIPTION |
| NAME | NO. | | |
| SERIAL CONTROL | INTERFACE | T | |
| I2C_SDA | 23 | OD | I2C Data and Clock Pins. Typically pulled up by 470- Ω to 4.7-k Ω resistors to either 1.8-V or 3.3-V supply rail depending on IDX setting. See Section 7.5.1 for further details on the I2C implementation of the |
| I2C_SCL | 24 | OD | DS90UB635-Q1. |
| CONFIGURATION | and CONTROL | | |
| RES0 | 7 | I | Reserved pin – Connect to GND |
| RES1 | 22 | I | Reserved pin – Do not connect (leave floating) |
| PDB | 8 | I, PD | Power-down inverted Input Pin. Internal 1-MΩ pulldown. Typically connected to processor GPIO with pull down. When PDB input is brought HIGH, the device is enabled and internal register and state machines are reset to default values. Asserting PDB signal low will power down the device and consume minimum power. The default function of this pin is PDB = LOW; POWER DOWN. PDB should remain low until after power supplies are applied and reach minimum required levels. See <i>Section 9.2</i> for further details on the function of PDB. PDB INPUT IS NOT 3.3-V TOLERANT. PDB = 1.8 V, device is enabled (normal operation) PDB = 0, device is powered down. |
| MODE | 21 | I, S | Mode select configuration input. Default operational mode will be strapped at start-up based on the MODE input voltage when PDB transitions LOW to HIGH. Typically connected to voltage divider through external pullup to VDD18 and pulldown to GND applying an appropriate bias voltage. See Section 7.4.2 for details. |
| CLK_OUT/IDX | 19 | I/O, S | IDX pin sets the I2C pullup voltage and device address; connect to external pullup to VDD and pulldown to GND to create a voltage divider. When PDB transitions LOW to HIGH, the strap input voltage is sensed at the CLOCK_OUT/IDX pin to determine functionality and then converted to CLK_OUT. See Section 7.5.1 for details. If CLK_OUT is used, the minimum resistance on the pin is 35 k Ω . If unused, CLK_OUT/IDX may be tied to GND. |
| FPD-LINK III INTER | RFACE | | |
| DOUT- | 13 | I/O | FPD-Link III Input/Output pins. These pins must be AC-coupled. See Figure 8-5 and Figure 8-6 for typical |
| DOUT+ | 14 | I/O | connection diagrams and Table 8-3 for recommended capacitor values. |
| POWER AND GRO | UND | • | |
| VDDD_CAP | 26 | D, P | A connection for an internal analog regulator decoupling capacitor. Typically connected to 10-μF, 0.1-μF, and 0.01-μF capacitors to GND. Do not connect to an external supply rail. See Section 8.2 for more details. |
| VDDDRV_CAP | 15 | D, P | A connection for an internal analog regulator decoupling capacitor. Typically connected to 10-μF, 0.1-μF, and 0.01-μF capacitors to GND. Do not connect to an external supply rail. See <i>Section 8.2</i> for more details. |
| VDDPLL_CAP | 10 | D, P | A connection for an internal analog regulator decoupling capacitor. Typically connected to 10-μF, 0.1-μF, and 0.01-μF capacitors to GND. Do not connect to an external supply rail. See Section 8.2 for more details. |
| VDDD | 25 | Р | 1.8-V (±5%) Power Supply pin. Typically connected to 1-μF and 0.01-μF capacitors to GND. |
| VDDDRV | 16 | Р | 1.8-V (±5%) Analog Power Supply pin. Typically connected to 1-μF and 0.01-μF capacitors to GND. |
| VDDPLL | 11 | Р | 1.8-V (±5%) Analog Power Supply pin. Typically connected to 1-μF and 0.01-μF capacitors to GND. |
| GND | DAP | G | DAP is the large metal contact at the bottom side, located at the center of the VQFN package. Connect to the ground plane (GND). |
| LOOP FILTER | | | |
| LPF1 | 9 | Р | Loop Filter 1: Connect as described in Section 8.2.2.4. |
| LPF2 | 12 | Р | Loop Filter 2: Connect as described in Section 8.2.2.4. |
| CLOCK INTERFAC | E AND GPIO | | |
| GPIO_0 | 17 | I/O, PD | General-Purpose Input/Output pins. These pins can also be configured to sense the voltage at their |
| GPIO_1 | 18 | I/O, PD | inputs. See Section 7.3.4.3. At power up, these GPIO pins default to inputs with a 300-kΩ (typical) internal pulldown resistor. These pins may be left floating if unused, but TI recommends to set the GPIOx_INPUT_EN to 0 to disable the pins. See Section 7.3.6 for programmability. |
| GPIO_2 | 27 | I/O, PD | General-Purpose Input/Output pins. At power up, these GPIO pins default to inputs with a 300-kΩ (typical |
| GPIO_3 | 28 | I/O. PD | internal pulldown resistor. These pins may be left floating if unused, but TI recommends to set the GPIOx_INPUT_EN to 0 to disable the pins. See Section 7.3.6 for programmability. |
| CLKIN | 20 | ı | Reference Clock Input pin. If operating in non-sync external clock mode, connect this pin to a local clock source. If unused (like other clocking modes), this pin may be left open. See Table 7-8 for more information on clocking modes. |

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)(1)

| , | PIN OR FREQUENCY | MIN | MAX | UNIT |
|--|--|------|-----------------------|------|
| Supply voltage, VDD | VDDD, VDDDRV, VDDPLL | -0.3 | 2.16 | V |
| Input voltage | GPIO[3:0], PDB, CLKIN, IDX, MODE, CSI_CLKP/N, CSI_D0P/N, CSI_D1P/N, CSI_D2P/N, CSI_D3P/N | -0.3 | V _{DD} + 0.3 | V |
| FPD-Link III output voltage | DOUT+, DOUT- | -0.3 | 1.21 | V |
| Open-drain voltage | I2C_SDA, I2C_ SCL | -0.3 | 3.96 | V |
| Junction temperature, T _J | | | 150 | °C |
| Storage termperature, T _{stg} | | -65 | 150 | °C |

⁽¹⁾ Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

| | | | | VALUE | UNIT |
|--------------------|--|--|--|--------|------|
| | | Human body model (HBM) ESD | All pins except Media Dependent Interface Pins | ±4000 | V |
| | | Classification Level 3A, per AEC Q100-002 ⁽¹⁾ | Media Dependent Interface Pins | ±4000 | |
| | Electrostatic discharge $R_D = \frac{Q100}{R_D}$ | Charged-device model (CDM) ESD Cl. Q100-011 | rged-device model (CDM) ESD Classification Level C6, per AEC 0-011 | | V |
| V _(ESD) | | IEC 61000-4-2 | Contact Discharge (DOUT+ and DOUT-) | ±8000 | V |
| | | $R_D = 330 \ \Omega, \ C_S = 150 \ pF$ | Air Discharge (DOUT+ and DOUT-) | ±18000 | V |
| | | ISO 10605 | Contact Discharge (DOUT+ and DOUT-) | ±8000 | V |
| | | R_D = 330 Ω, C_S = 150 pF and 330 pF R_D = 2 kΩ, C_S = 150 pF and 330 pF | Air Discharge (DOUT+ and DOUT-) | ±18000 | V |

⁽¹⁾ AEC Q100-002 indicates HBM stressing is done in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

6.3 Recommended Operating Conditions

Over operating free-air temperature range (unless otherwise noted)

| | | MIN | NOM | MAX | UNIT |
|---|---|------|-----|------|------------------------------|
| Supply voltage | VDD (VDDD, VDDDRV, VDDPLL) | 1.71 | 1.8 | 1.89 | V |
| Open-drain voltage | I2C_SDA, I2C_SCL = V _(I2C) | 1.71 | | 3.6 | V |
| Operating free-air temperature (T _A) | | -40 | 25 | 105 | °C |
| Mipi data rate (per CSI-2 lane) | | 600 | | 832 | Mbps |
| Reference clock input frequency | | 25 | | 104 | MHz |
| Local I ² C frequency (f _{I2C}) | | | | 1 | MHz |
| Supply noise ⁽³⁾ | VDD (VDDD, VDDDRV, VDDPLL) | | | 25 | mV _{p-p} |
| | f = 10 KHz - 50 MHz (coax mode only) | | | 25 | mV_{p-p} |
| Differential supply noise between DOUT+ and DOUT- (PSR) | f = 30 Hz, 10-90% Rise/Fall Time > 100µs (coax mode only) | | | 25 | mV_{p-p} |
| Input clock jitter for non-synchronous mode (t _{JIT}) | CLKIN | | | 0.05 | UI_CLK_I N ⁽²⁾ |
| Back channel input jitter (t _{JIT-BC}) | DOUT+, DOUT- | | | 0.4 | UI_BC(1) |

⁽¹⁾ The back channel unit interval (UI_BC) is 1/(BC line-rate). For example, the typical UI_BC is 1/100 MHz = 10 ns. If the jitter tolerance is 0.4 UI, convert the jitter in UI to seconds using this equation: 10 ns × 0.4 UI = 4 ns

6.4 Thermal Information

| | | DS90UB635-Q1 | |
|-----------------------|--|--------------|------|
| | THERMAL METRIC ⁽¹⁾ | RHB (VQFN) | UNIT |
| | | 32 PINS | |
| $R_{\theta JA}$ | Junction-to-ambient thermal resistance | 31.5 | °C/W |
| $R_{\theta JB}$ | Junction-to-board thermal resistance | 10.9 | °C/W |
| R _{θJC(top)} | Junction-to-case (top) thermal resistance | 20 | °C/W |
| R _{θJC(bot)} | Junction-to-case (bottom) thermal resistance | 1 | °C/W |
| Ψ_{JT} | Junction-to-top characterization parameter | 0.2 | °C/W |
| Ψ_{JB} | Junction-to-board characterization parameter | 10.9 | °C/W |

⁽¹⁾ For more information about traditional and new thermal metrics, see the Semiconductor and IC Package Thermal Metrics application report, SPRA953.

Submit Document Feedback

⁽²⁾ Non-synchronous mode - For a given clock, the UI is defined as 1/clock_freq. For example when the clock = 50Mhz, the typical UI_CLK_IN is 1/50 MHz = 20 ns.

⁽³⁾ DC - 50 MHz

6.5 Electrical Characteristics

Over recommended operating supply and temperature ranges unless otherwise specified.

| | PARAMETER | TEST CONDITIONS | PIN OR FREQUENCY | MIN | TYP | MAX | UNIT |
|-----------------------|------------------------------|--|----------------------------|---------------------------|-----|---------------------------|------|
| POWER C | ONSUMPTION | | ' | | | | |
| I _{DD_TOTAL} | | 416-MHz CSI Input Clock, 4 Lane Mode, | VDDPLL, VDDD, VDDDRV | | 160 | 225 | |

7 Detailed Description

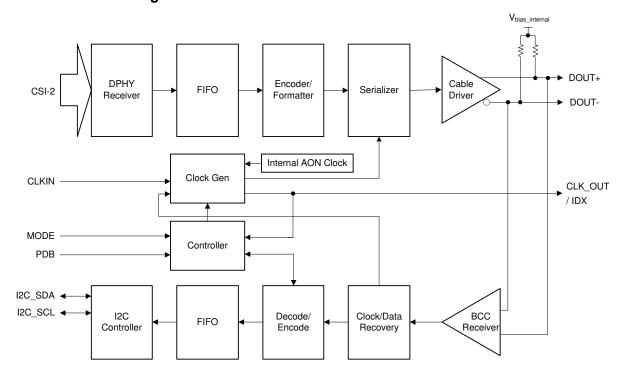

7.1 Overview

The DS90UB635-Q1 serializes data from high-resolution image sensors or other sensors using the MIPI CSI-2 interface. The DS90UB635-Q1 serializer is optimized to interface with the DS90UB63x-Q1 deserializers, the DS90UB66x-Q1 deserializers (quad hubs), as well as other potential future deserializers. The interconnect between the serializer and the deserializer can be either a coaxial cable or shielded-twisted pair (STP) cable. The DS90UB635-Q1 was designed to support multi-sensor systems such as surround view, and as such has the ability to synchronize sensors through the DS90UB63x-Q1 and DS90UB66x-Q1 hubs.

The DS90UB635-Q1 serializer and companion deserializer incorporate an I2C-compatible interface. The I2C-compatible interface allows programming of serializer or deserializer devices from a local host controller. In addition, the devices incorporate a bidirectional control channel (BCC) that allows communication between the serializer and deserializer, as well as between remote I2C target devices.

The bidirectional control channel (BCC) is implemented through embedded signaling in the high-speed forward channel (serializer to deserializer), combined with lower speed signaling in the reverse channel (deserializer to serializer). Through this interface, the BCC provides a mechanism to bridge I2C transactions across the serial link from one I2C bus to another.

7.2 Functional Block Diagram

7.3 Feature Description

The DS90UB635-Q1 FPD-Link III serializer is designed to support high-speed raw data sensors including 2-MP imagers at 60 fps, as well as 4-MP and 30-fps cameras, satellite RADAR, LIDAR, and time of flight (ToF) cameras. The chip features a forward channel capable of up to 4.16 Gbps, as well as an ultra-low latency 50-Mbps bidirectional control channel. The transmission of the forward channel, bidirectional control channel, and power is supported over coaxial (Power-over-Coax) or STP cables. The DS90UB635-Q1 features advanced data protection and diagnostic features to support ADAS and autonomous driving. Together with a companion deserializer, the DS90UB635-Q1 delivers precise multi-camera sensor clock and sensor synchronization.

7.3.1 CSI-2 Receiver

The DS90UB635-Q1 receives CSI-2 video data from the sensor. During CSI-2 operation, the D-PHY consists of a clock lane and one or more data lanes. The DS90UB635-Q1 is a target device and only supports unidirectional lane in the forward direction. Low Power Escape mode is not supported.

7.3.1.1 CSI-2 Receiver Operating Modes

During normal operation a data lane will be in either control or high-speed mode. In high-speed mode, the data transmission happens in a burst and starts and ends at a stop state (LP-11). There is a transition state to take the D-PHY from a normal mode to the low-power state.

The sequence to enter high-speed mode is: LP-11, LP-01, LP-00. After the sequence is entered, the data lane remains in high-speed mode until a stop state (LP-11) is received.

7.3.1.2 CSI-2 Receiver High-Speed Mode

During high-speed data transmission, the digital D-PHY will enable termination signal to allow proper termination of the HS RX of the Analog D-PHY, and the LP RX should stay at LP-00 state. Both CSI-2 data lane and clock lane operate in the same manner. The DS90UB635-Q1 supports both CSI-2 continuous and non-continuous clock lane modes which must be set using register 0x02[6] and should follow the image sensor clock mode. In the continuous clock lane mode, the clock lane remains in high-speed mode.

7.3.1.3 CSI-2 Protocol Layer

There are two different types of CSI-2 packets: a short packet and a long packet. Short packets have information such as the frame start/ line start, and long packets carry the data after the frame start is asserted. Figure 7-1 shows the structure of the CSI-2 protocol layer with short and long packets. The DS90UB635-Q1 supports 1, 2, and 4 lane configurations.

DATA:

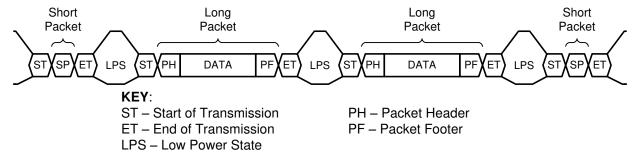

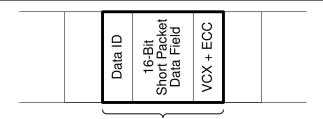

Figure 7-1. CSI-2 Protocol Layer With Short and Long Packets

7.3.1.4 CSI-2 Short Packet

The short packet provides frame or line synchronization. Figure 7-2 shows the structure of a short packet. A short packet is identified by data types 0x00 to 0x0F.

32-bit SHORT PACKET (SH) Data Type (DT) = 0x00 - 0x0F

Figure 7-2. CSI-2 Short Packet Structure

7.3.1.5 CSI-2 Long Packet

A long packet consists of three elements: a 32-bit packet header (PH), an application-specific data payload with a variable number of 8-bit data words, and a 16-bit packet footer (PF). The packet header is further composed of three elements: an 8-bit data identifier, a 16-bit word count field, and an 8-bit ECC. The packet footer only has one element—a 16-bit checksum. Figure 7-3 shows the structure of a long packet.

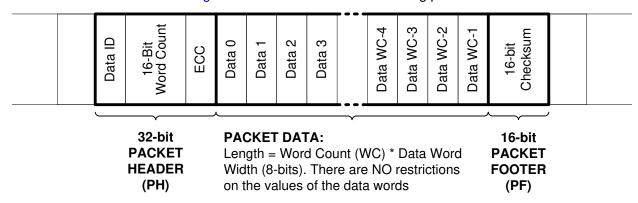

Figure 7-3. CSI-2 Long Packet Structure

Table 7-1. CSI-2 Long Packet Structure Description

| PACKET PART | FIELD NAME | SIZE (BIT) | DESCRIPTION | |
|-------------|--------------|------------|--|--|
| | VC / Data ID | 8 | Contains the virtual channel identifier and the data-type information. | |
| Header | Word Count | 16 | Number of data words in the packet data. A word is 8 bits. | |
| rioddor | ECC | 8 | ECC for data ID and WC field. Allows 1-bit error recovery and 2-bit error detection. | |
| Data | Data | WC × 8 | Application-specific payload (WC words of 8 bits). | |
| Footer | Checksum | 16 | 16-bit cyclic redundancy check (CRC) for packet data. | |

7.3.1.6 CSI-2 Errors and Detection

7.3.1.6.1 CSI-2 ECC Detection and Correction

CSI-2 packet header contains 6-bit Error Correction Code (ECC). ECC in the 32-bit long packet header can be corrected when there is a 1-bit error and detected when there is a 2-bit error. This feature is added to monitor the CSI-2 input for ECC 1-bit error correction. When ECC error is detected, ECC error detection register will be set and an alarm indicator bit can be sent to the deserializer to indicate the ECC error has been detected. A register control can be used to either enable or disable the alarm.

7.3.1.6.2 CSI-2 Check Sum Detection

A CSI-2 long packet header contains a 16-bit check sum before the end of transmission. The DS90UB635-Q1 calculates the check sum of the incoming CSI-2 data. If a check sum error is detected, the check sum error status can be saved in the CSI_ERR_STATUS register (0x5D), then forwarded to the deserializer through the bidirectional control channel.

7.3.1.6.3 D-PHY Error Detection

DS90UB635-Q1 detect and reports SoT and SoT Sync errors.

7.3.1.6.4 CSI-2 Receiver Status

For the receive ports, several status functions can be tracked and monitored through register access. The status indications are available for error conditions as well as indications of change in line length measurements. These are available through the CSI_ERR_CNT (0x5C), CSI_ERR_STATUS (0x5D), CSI_ERR_DLANE01 (0x5E), CSI_ERR_DLANE01 (0x5E), and CSI_ERR_CLK_LANE (0x60) registers.

7.3.2 FPD-Link III Forward Channel Transmitter

The DS90UB635-Q1 features a high-speed signal transmitter capable of driving signals at rates of up to 4.16 Gbps.

7.3.2.1 Frame Format

The DS90UB635-Q1 formats the data into 40-bit long frames. Each frame is encoded to ensure DC balance and to ensure sufficient data line transitions. Each frame contains video payload data, I2C forward channel data, CRC information, framing information, and information regarding the state of the CSI-2 interface.

7.3.3 FPD-Link III Back Channel Receiver

The FPD-Link III back channel receives an encoded back channel signal over the FPD-Link III interface. The back channel frame is a 30-bit frame that contains I2C commands and GPIO data. The back channel frame receives an encoded clock and data from the deserializer, thus the data bit rate is one-half the frequency of the highest frequency received.

The back channel frequency is programmable for operation with compatible deserializers. The default setting is determined by the MODE strap pin. For operation with the DS90UB638-Q1 or DS90UB662-Q1, the back channel should be programmed for 50-Mbps operation in DS90UB635-Q1 synchronous mode and programmed for 10-Mbps operation for non-synchronous modes.

7.3.4 Serializer Status and Monitoring

The DS90UB635-Q1 features enhanced FPD-Link III diagnostics, system monitoring, and Built-In Self Test capabilities. The device monitors forward channel and back channel data for errors and reports them in the status registers. The device also supports voltage and temperature measurement for system level diagnostics. The Built-In Self Test feature allows testing of the forward channel and back channel data transmissions without external data connections.

The DS90UB635-Q1 can send alarms and sensor status data through the forward channel to monitor the CSI-2 interface, Bidirectional Control Channel (BCC), GPIO voltage sensors and internal temperature sensor. The data can then be accessed through the SENSOR_STS_X registers (0x51) to (0x54) on the compatible linked deserializer. Status bits are always transmitted, and transmission of Alarm bits needs to be enabled from registers (0x1C) to (0x1E) on the serializer.

The CSI-2 error status and alarms on the deserializer SENSOR_STS are: CSI-2 alarm, CSI-2 control error, CSI-2 synchronization error, CSI-2 start of transmission error, CSI-2 checksum error, and CSI-2 ECC 2-bit error. The status for these bits can also be read from registers (0x5D) to (0x60) on the serializer. The BCC error alarm is triggered by are BCC link detect and CRC errors which can be read from register (0x52).

The voltage sense level and voltage sense alarms correspond to Sensor V0 (0x58) and Sensor V1 (0x59). And the temperature sense levels and alarm are monitored from Sensor T (0x5A).

7.3.4.1 Forward Channel Diagnostics

The DS90UB635-Q1 monitors the status of the forward channel link. The forward channel high-speed PLL lock status is reported in the HS_PLL_LOCK bit (Register 0x52[2]). When paired with the DS90UB638-Q1 or DS90UB662-Q1, the FPD-Link III deserializer LOCK status is also reported in the RX_LOCK_DETECT bit (Register 0x52[6]).

7.3.4.2 Back Channel Diagnostics

The DS90UB635-Q1 monitors the status of the back channel link. The back channel CRC errors are reported in the CRC_ERR bit (Register 0x52[1]). The number of CRC errors are stored in the CRC error counters and reported in the CRC_ERR_CNT1 (Register 0x55) and CRC_ERR_CNT2 (Register 0x56) registers. The CRC error counters are reset by setting the CRC_ERR_CLR (Register 0x49[3]) to 1.

When running the BIST function, the DS90UB635-Q1 reports if a BIST CRC error is detected in the BIST_CRC_ERR bit (Register 0x52[3]). The number of BIST errors are reported in the BIST_ERR_CNT field (Register 0x54). The BIST CRC error counter is reset by setting the BIST_CRC_ERR_CLR (Register 0x49[5]) to 1.

7.3.4.3 Voltage and Temperature Sensing

The DS90UB635-Q1 supports voltage measurement and temperature measurement. The temperature and voltage sensors are both equipped with a 3-bit ADC. The engineer can configure these sensors to monitor a signal and raise a flag when a signal goes outside of a set limit. For example, a voltage sensor can be used to monitor the 1.8-V line and raise a flag if the voltage goes above 1.85 V or below 1.75 V. This flag can then be transferred to the deserializer and set an interrupt at the deserializer end of the link. In a similar manner, the temperature sensor will trigger an alarm bit when the internal temperature of DS90UB635-Q1 is outside the range.

Both GPIO0 and GPIO1 can be configured to sense the voltage applied at their inputs. Table 7-32 through Table 7-38 cover the registers specific to this section.

For a given voltage or temperature, the measurement accuracy is ±1 LSB. This means that for a given input voltage or temperature corresponding to the nearest value in Table 7-2 and Table 7-3, the resulting ADC output code will be accurate to the nearest ±1 code.

Table 7-2. ADC Code vs Input Voltage

| GPIO VIN (V) | CODE |
|-------------------|------|
| VIN < 0.85 | 000 |
| 0.85 < VIN < 0.90 | 001 |
| 0.90 < VIN < 0.95 | 010 |
| 0.95 < VIN < 1.00 | 011 |
| 1.00 < VIN < 1.05 | 100 |
| 1.05 < VIN < 1.10 | 101 |
| 1.10 < VIN < 1.15 | 110 |
| 1.15 < VIN | 111 |
| | |

Table 7-3. ADC Code vs Temperature

| TEMPERATURE (°C) | CODE |
|------------------|------|
| T < -30 | 000 |
| -30 < T < -10 | 001 |
| -10 < T < 15 | 010 |
| 15 < T < 35 | 011 |
| 35 < T < 55 | 100 |
| 55 < T < 75 | 101 |
| 75 < T < 100 | 110 |
| 100 < T | 111 |

7.3.4.3.1 Programming Example

This section gives an example on how to configure the DS90UB635-Q1 and DS90UB638-Q1 to monitor the voltage on the DS90UB635-Q1 GPIO1 and set an alarm, which can then assert the INT pin on the DS90UB638-Q1

```
# DS90UB635-Q1 Settings
WriteI2C(0x17,0x3E) # Enable Sensor, Select GPI01 to sense
WriteI2C(0x18,0xB2) # Enable Sensor Gain Setting (Use Default)
WriteI2C(0x1A,0x62) # Set Sensor Upper and Lower Limits (Use Default)
WriteI2C(0x1D,0x3F) # Enable Sensor Alarms
WriteI2C(0x1E,0x7F) # Enable Sending Alarms over BCC
# Register 0x57 readout (bits 2 and 3), indicates if the voltage on the GPI01 is below or above the thresholds set in the register 0x1A.
# DS90UB638-Q1 Settings
WriteI2C(0x23,0x81) # Enable Interrupts, Enable Interrupts for the camera attached to RX0
WriteI2C(0x4C,0x01) # Enable Writes to RX0 registers
WriteI2C(0xD8,0x08) # Interrupt on change in Sensor Status
# Register 0x51 and 0x52 readouts indicate Sensor data. Register 0x24[7] bit readout indicates the Alarm bit. The alarm bit can be routed to GPI03/INT through GPI0_PIN_CTL and GPI0_OUT_SRC registers.
```

7.3.4.4 Built-In Self Test

An optional at-speed Built-In Self Test (BIST) feature supports high-speed serial link and back channel testing without external data connections. This is useful in the prototype stage, equipment production, in-system test, and system diagnostics.

BIST mode is enabled by the BIST configuration register 0xB3[0] on the deserializer, and should only run in the synchronous mode. When BIST is activated at the deserializer, a BIST enable signal is sent to the serializer through the back channel. The serializer outputs a continuous stream of a pseudo-random sequence and drives the link at speed. The deserializer detects the test pattern and monitors the pattern for errors. The serializer also tracks errors indicated by the CRC fields in each back channel frame. While the lock indications are required to identify the beginning of proper data reception, the best indication of any link failures or data corruption is the content of the error counter in the BIST_ERR_COUNT register 0x57 for each RX port on the deserializer side. BIST mode is useful in the prototype stage, equipment production, in-system test, and system diagnostics.

7.3.5 FrameSync Operation

When paired with compatible descrializers, any of the DS90UB635-Q1 GPIO pins can be use for frame synchronization. This feature is useful when multiple sensors are connected to a descrializer hub. A frame synchronization signal (FrameSync) can be sent through the back channel using any of the back channel GPIOs. The FrameSync signal arrives at the serializers with limited skew.

7.3.5.1 External FrameSync

In External FrameSync mode, an external signal is input to the deserializer through one of the GPIO pins on the device. The external FrameSync signal may be propagated to one or more of the attached FPD-Link III serializers through a GPIO signal in the back channel. The expected skew timing for external FrameSync mode is on the order of one back channel frame period or 600 ns when operating at 50 Mbps.

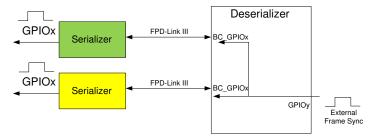

Figure 7-4. External FrameSync

Enabling the external FrameSync mode is done on the deserializer side. Refer to the deserializer data sheet for more information.

7.3.5.2 Internally Generated FrameSync

In Internal FrameSync mode, an internally generated FrameSync signal is sent to one or more of the attached FPD-Link III Serializers through a GPIO signal in the back channel.

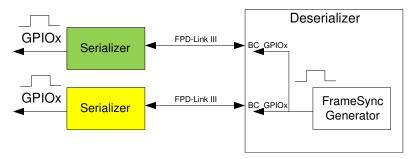

Figure 7-5. Internal FrameSync

FrameSync operation is controlled by the deserializer registers. Refer to the deserializer data sheet for more information.

7.3.6 GPIO Support

The DS90UB635-Q1 supports four pins, GPIO0 through GPIO3, which can be monitored, configured, and controlled through the I2C bus in registers 0x0D, 0x0E, and 0x53. These GPIOs are programmable for use in multiple situations. GPIO0 and GPIO1 have additional diagnostics functionality and may be programmed to sense external voltage levels.

7.3.6.1 GPIO Status

The status HIGH or LOW of each GPIO pin 0 through 3 may be read through the GPIO STS bits in the GPIO PIN STS register 0x53. This register read operation provides the status of the GPIO pins when they are configured as an input by setting the corresponding GPIOx INPUT EN bits in the GPIO INPUT CTRL register (0x0E). To read the GPIO status when the GPIO is used as output, both GPIOx INPUT EN and GPIOx OUT EN bits in the GPIO INPUT CTRL register (0x0E) can be set.

| | Table | e 7-4. GPIO Configura | ation |
|-------------|-------|-----------------------|-------|
| nfiguration | Valid | Valid | Valid |
| | | | |

| Configuration | Valid | Valid | Valid | Not Valid | | |
|----------------|---------------------|---------------------|--------------------|--------------------|--|--|
| Purpose | GPIO used as Output | GPIO used as Output | GPIO used as Input | GPIO used as Input | | |
| GPIOx_INPUT_EN | 0 | 1 ⁽¹⁾ | 1 | 1 | | |
| GPIOx_OUT_EN | 1 | 1 | 0 | 1 | | |
| GPIO_STS | non-functional | functional | functional | N/A | | |

Note

(1) When GPIOx INPUT EN is set, the internal pull down will be connected to the GPIO output and the user should ensure that the pull down resistor will not interfere with the application-specific use.

7.3.6.2 GPIO Input Control

Upon initialization, GPIO0 through GPIO3 are enabled as inputs by default. The GPIO INPUT CTRL (0x0E) register (bits 3:0) allows control of the input enable. If a GPIO INPUT CTRL[3:0] bit is set to 1, then the corresponding GPIO INPUT CTRL[7:4] bit must be set to 0. The number of GPIOs should be set and enabled using FC GPIO EN in register (0x33).

7.3.6.3 GPIO Output Control

Individual GPIO output control is programmable through the GPIO_INPUT_CTRL (0x0E) register (bits 7:4) in Table 7-27. The GPIO INPUT CTRL[7:4] bits should be set to 1 to use the GPIOs as output pins.

7.3.6.4 Forward Channel GPIO

The input on the DS90UB635-Q1 GPIO pins can be forwarded to compatible deserializers over the FPD-Link III interface. Up to four GPIOs are supported in the forward direction.

The timing for the forward channel GPIO is dependent on the number of GPIOs assigned at the serializer. When a single GPIO input from the DS90UB635-Q1 serializer is linked to a compatible deserializer GPIO output, the value is sampled at every forward channel transmit frame. Two linked GPIO are sampled every two forward channel frames, and three or four linked GPIO are sampled every five frames. The typical latency for the GPIO is approximately 225 ns but will vary with the length of the cable. As the information is spread over multiple frames, the jitter is typically increased on the order of the sampling period (number of forward channel frames). TI recommends that the user maintain a 4x oversampling ratio for linked GPIO throughput. For example, when operating in 4-Gbps synchronous mode with REFCLK = 25 MHz, the maximum recommended GPIO input frequency based on the number of GPIO linked over the forward channel is shown in Table 7-5.

Table 7-5. Forward Channel GPIO Typical Timing

| NUMBER OF LINKED FORWARD CHANNEL GPIOs (FC_GPIO_EN) | SAMPLING FREQUENCY (MHz) AT FPD-Link III LINE RATE = 4 Gbps | MAXIMUM RECOMMENDED FORWARD CHANNEL GPIO FREQUENCY (MHz) | TYPICAL LATENCY (ns) | TYPICAL JITTER (ns) |
|--|--|--|----------------------|---------------------|
| 1 | 100 | 25 | 225 | 12 |
| 2 | 50 | 12.5 | 225 | 24 |
| 4 | 20 | 5 | 225 | 60 |

7.3.6.5 Back Channel GPIO

When enabled as an output, each DS90UB635-Q1 GPIO pin can be programed to output remote data coming from the compatible deserializer using the LOCAL_GPIO_DATA register (0x0D). The maximum signal frequency that can be received over the FPD-Link III back channel is dependent on the DS90UB635-Q1 clocking mode as shown in Table 7-6.

Table 7-6. Back Channel GPIO Typical Timing

| DS90UB635-Q1 CLOCKING MODE | BACK CHANNEL RATE (Mbps) | SAMPLING FREQUENCY (kHz) | MAXIMUM RECOMMENDED BACK CHANNEL GPIO FREQUENCY (kHz) | TYPICAL LATENCY (µs) | TYPICAL JITTER (μs) |
|----------------------------|-----------------------------|--------------------------------|---|-------------------------|---------------------|
| Synchronous Mode | 50 | 1670 | 416 | 1.5 | 0.7 |
| Non-Synchronous Modes | 10 | 334 | 83.5 | 3.2 | 3 |
| DVP Mode | 2.5 | 83.5 | 20 | 12.2 | 12 |

Product Folder Links: DS90UB635-Q1

7.3.7 Unique ID

Each device is programmed with a Unique DIE-ID that is burnt into devices at wafer level; Unique DIE-ID with a 16 bytes customer readable value indicating wafer lot and position of each IC inside a wafer. Combination of Unique DIE-IDs can be read and maintained by customer in a database or in a Hash table. Each system can be identified by the Unique DIE-ID programmed into the devices. Authenticity of the overall system can be established at the powerup/initialization or periodically by checking the Unique DIE-ID.

A Unique DIE-ID is programmed into each device and can be read using I2C reads. To read the Unique DIE-ID, set the IA SEL (0xB0[4:2]) register to DIE ID Data (010), then set register IND ACC ADDR (0xB1) address to the Unique ID register being read, and then read the IND ACC DATA (0xB2) register to get the Unique DIE-ID. There are 16 Unique ID registers, each of the registers contain 8 bits of the total unique DIE-ID. The table below lists the Unique ID registers addresses.

Unique ID register IND ACC ADDR address UNIQUE_ID_0 0x00UNIQUE ID 1 0x01 UNIQUE ID 2 0x02 UNIQUE_ID_3 0x03UNIQUE ID 4 0x04 UNIQUE ID 5 0x05 UNIQUE_ID_6 0x06 UNIQUE ID 7 0x07 UNIQUE ID 8 80x0 UNIQUE ID 9 0x09 UNIQUE_ID_10 0x0A UNIQUE ID 11 0x0B UNIQUE ID 12 0x0C UNIQUE ID 13 0x0D UNIQUE ID 14 0x0E UNIQUE_ID_15 0x0F

Table 7-7. Unique ID Registers

7.4 Device Functional Modes

7.4.1 Clocking Modes

The DS90UB635-Q1 supports several clocking schemes, which are selected through the MODE pin. In the DS90UB635-Q1, the forward channel operates at a higher bandwidth than the requirement set by the video data transported, and the forward channel data rate is set by a reference clock. The clocking mode determines what the device uses as the reference clock, and the most common configuration is synchronous mode in which no local reference oscillator is required. See Table 7-8 for more information.

The default mode of the DS90UB635-Q1 is set by the application of a bias on the MODE pin during power up. More information on setting the operation modes can be found in Section 7.4.2.

| Table | 7-8. | Clocking | Modes |
|-------|------|----------|-------|
| | | | |

| MODE | DIVIDE | REFERENCE SOURCE | REF FREQUENCY (MHz) | FC DATA RATE | CSI BANDWIDTH ≤ ⁽⁴⁾ | CLK_OUT (3) |
|----------------------------|--------|-----------------------------|---------------------------|--------------|-----------------------------------|------------------------------------|
| Synchronous | N/A | Back Channel ⁽¹⁾ | 23 - 26 | f × 160 | f × 128 | f × 160 / HS_CLK_DIV × (M/N) |
| Synchronous (Half-rate) | N/A | Back Channel ⁽¹⁾ | 11.5 - 13 | f × 160 | f × 128 | f × 160 / HS_CLK_DIV × (M/N) |

Table 7-8. Clocking Modes (continued)

| | | 14510 7 01 0100 | | | | |
|---|----------------------------------|-------------------------------|---------------------------|--------------|-----------------------------------|-----------------------------------|
| MODE | DIVIDE | REFERENCE SOURCE | REF FREQUENCY (MHz) | FC DATA RATE | CSI BANDWIDTH ≤ ⁽⁴⁾ | CLK_OUT (3) |
| Non-Synchronous external clock | CLKIN_DIV = 1, | External Clock ⁽²⁾ | 25 - 52 | f × 80 | f × 64 | f × 80 / HS_CLK_DIV × (M/N) |
| | CLKIN_DIV = 2, | External clock ⁽²⁾ | 50 - 104 | f × 40 | f × 32 | f × 40 / HS_CLK_DIV × (M/N) |
| Non-Synchronous Internal Clock | CLKIN_DIV = 1, OSCCLK_SEL = 1 | 635 Internal Clock | 48.4 - 51 | f × 80 | f × 64 | N/A |
| Non-Synchronous Internal Clock (Half-rate) | OSCCLK_SEL = 0 | 635 Internal Clock | 24.2 - 25.5 | f × 80 | f × 64 | N/A |
| DVP External Clock Deserializer Mode: RAW10 | N/A | External clock | 25 - 66.5 | f × 28 | f × 20 | f × 28 / HS_CLK_DIV × (M/N) |
| DVP External Clock Deserializer Mode: RAW12 HF | N/A | External clock | 25 - 70 | f × 28 | f × 18 | f × 28 / HS_CLK_DIV × (M/N) |

- (1) The back channel is recovered from the FPD-Link III bidirectional control channel. A local reference clock source is not required. Refer to the deserializer data sheet for the back channel frequency settings.
- (2) A local reference clock source is required. Provide a clock source to the DS90UB635-Q1's CLKIN pin.
- (3) HS CLK DIV typically should be set to either 16, 8, or 4 (default).
- (4) CSI-2 lane speed must be ≥ 600Mbps/lane

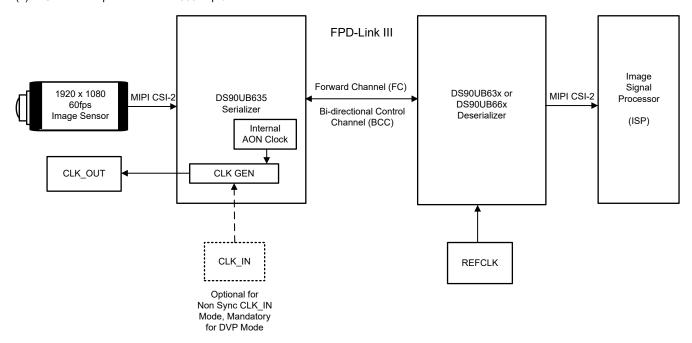

Figure 7-6. Clocking System Diagram

7.4.1.1 Synchronous Mode

Operation in synchronous mode offers the advantage that the receiver and all of the sensors in a multi-sensor system are locked to a common clock in the same clock domain, which reduces or eliminates the need for data buffering and resynchronization. The synchronous clocking mode also eliminates the cost, space, and potential failure point of a reference oscillator within the sensor module.

In this mode, a clock is passed from the deserializer to the serializer through the FPD-Link III back channel, and the serializer is able to use this clock both as a reference clock for an attached image sensor, as well as a reference clock for the link back to the deserializer (FPD-Link III forward channel). For operation in this mode, the DS90UB635-Q1 must be paired with a deserializer that can support this feature such as the DS90UB638-Q1 or the DS90UB662-Q1.

7.4.1.2 Non-Synchronous Clock Mode

In the non-synchronous clock mode, the external reference clock is supplied to the serializer. The serializer uses this clock to derive the FPD-Link III forward channel and an external reference clock for an attached image sensor. When in CSI-2 mode, the CSI-2 interface may be synchronous to this clock. The CSI-2 rate must be lower than the line rate. For example, with a 52-MHz clock, the FPD-Link III forward channel rate is 4.16 Gbps, and the CSI-2 throughput must be 600 Mbps to 3.328 Gbps (see Table 7-8).

7.4.1.3 Non-Synchronous Internal Mode

In the non-synchronous internal clocking mode, the serializer uses the internal Always-on Clock (AON) as the reference clock for the forward channel. The OSCCLK SEL select must be asserted (0x05[3]=1) to enable maximum data rate when using internal clock mode, and the CLK_OUT function must be disabled. A separate reference is provided to the image sensor or ISP. The CSI-2 rate must be lower than the line rate. For example, with the internal clock of 48.4 MHz, the FPD-Link III forward channel rate is 3.872 Gbps and the CSI-2 throughput must be 600 Mbps to 3.097 Gbps (See Table 7-8).

7.4.1.4 DVP Backwards Compatibility Mode

The DS90UB635-Q1 serializer can be placed into DVP mode to be backward-compatible with the DS90UB6xx-Q1 deserializer in DVP Backwards Compatibility Mode. While the mode should have been configured using the Mode pin on the DS90UB635-Q1 serializer, the register MODE SEL register 0x03[2:0] can be used to verify or override the current mode. This field always indicates the mode setting of the device. When bit 4 of this register is 0, this field is read-only and shows the mode setting. Mode is latched from strap value when PDB transitions LOW to HIGH, and the value should read back 101 (0x5) if the resistive strap is set correctly to DVP external clock backward-compatible mode. Alternatively, when bit 4 of this register is set to 1, the MODE field is read/write and can be programmed to 101 to assign the correct backward-compatible MODE. This is shown in Table 7-16.

CSI-2 input data provided to the DS90UB635-Q1 serializer must be synchronized to the input frequency applied to CLKIN when using DVP external clock mode. The PCLK frequency output from the DS90UB6xx-Q1 deserializer will also be related to CLKIN when in DVP external clock mode. See Backward compatibility modes for operation with parallel output descrializers (SNLA270) for more information.

REGISTER REGISTER NAME **REGISTER DESCRIPTION** Used to override and verify strapped value, if necessary, and to configure for DVP with an 0X03 MODE SEL external clock. BC_MODE_SELE 0X04 Allows DVP mode overwrites to RAW 10 or RAW 12. CT Allows configuration of data in DVP mode. This includes data types like long, YUV, and specified 0X10 DVP_CFG Allows packets with certain data type regardless of RAW 10 or 12 mode if DVP DT MATCH EN 0X11 DVP DT is asserted.

Table 7-9. List of Registers Used for DVP Configuration

7.4.1.5 Configuring CLK OUT

When using the DS90UB635-Q1 in either synchronous or non-synchronous external clock modes, CLK OUT is intended as a reference clock for the image sensor. CLK OUT functionality is disabled when operating in non-synchronous internal clocking mode. The frequency of the external CLK OUT is set by (see Equation 1 and Equation 2).

$$CLK_OUT = FC \times \frac{M}{HS_CLK_DIV \times N}$$
(1)

where

 FC is the forward channel data rate, and M, HS_CLK_DIV, and N are parameters set by registers 0x06 and 0x07

$$\frac{FC}{HS_CLK_DIV} < 1.05 \text{ GHz}$$
 (2)

The PLL that generates CLK_OUT is a digital PLL, and as such, has very low jitter if the ratio N/M is an integer. If N/M is not an integer, then the jitter on the signal is approximately equal to HS_CLK_DIV/FC—so if it is not possible to have an integer ratio of N/M, it is best to select a smaller value for HS_CLK_DIV.

If a particular CLK_OUT frequency, such as 37.125 MHz, is required for a system, the designer can select the values M=9, N=0xF2, and HS_CLK_DIV=4 to achieve an output frequency of 37.190 MHz and a frequency error of 0.175% with an associate jitter of approximately 1 ns. Alternately, the designer could use M=1, N=0x1B, HS_CLK_DIV=4 for CLK_OUT = 37.037 MHz, and a frequency error of 0.24% for less jitter. A third alternative would be to use M=1, N=0x1B, and HS_CLK_DIV=4, but rather than using a 25.000-MHz reference clock frequency (REFCLK) for the deserializer in synchronous mode, use a frequency of 25.059 MHz. The 2x reference then fed to the DS90UB635-Q1 from the deserializer back channel will allow generating CLK_OUT = 37.124 MHz with both low jitter and a low frequency error.

7.4.2 **MODE**

The DS90UB635 can operate in one of many different modes. The default mode is selected by the bias voltage applied to the MODE pin during power-up. To set this voltage, a potential divider between VDD and GND is used to apply the appropriate bias After Power up, the MODE can be read, or changed through register access.

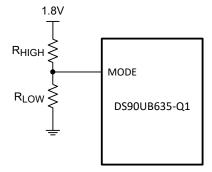

Figure 7-7. MODE Configuration

Table 7-10. Strap Configuration Mode Select

| MODE SELECT V _{TARGET} VOLTAGE RANGE | | | | | V _{TARGET} STRAP | SUGGESTED STRAP | | |
|---|-----------------------------------|-------------------------------|-------------------------------|-------------------------------|----------------------------|------------------------|-----------------------|--|
| | | IARGET | | | VOLTAGE | RESISTOR | S (1% TOL) | DESCRIPTION |
| MODE | NAME | RATIO MIN | RATIO TYP | RATIO MAX | V _(VDD) = 1.8 V | R _{HIGH} (kΩ) | R _{LOW} (kΩ) | |
| 0 | Synchronous | 0 | 0 | 0.133 x V _(VDD) | 0 | OPEN | 10 | CSI-2 Synchronous mode – FPD-Link III Clock reference derived from the deserializer. |
| 2 | Non-Synchronous External Clock | 0.288 x V _(VDD) | 0.325 x V _(VDD) | 0.367 x V _(VDD) | 0.586 | 75 | 35.7 | CSI-2 Non-synchronous clock – FPD-Link III Clock reference derived from external clock reference input on CLKIN pin. |
| 3 | Non-Synchronous Internal Clock | 0.412 x V _(VDD) | 0.443 x V _(VDD) | 0.474 x V _(VDD) | 0.792 | 71.5 | 56.2 | CSI-2 Non-synchronous – FPD-Link III Clock reference derived from internal AON clock. |
| 5 (1) | DVP Mode | 0.642 x V _(VDD) | 0.673 x V _(VDD) | 0.704 x V _(VDD) | 1.202 | 39.2 | 78.7 | DVP with External clock. |

⁽¹⁾ The DS90UB6xx-Q1 DVP deserializers also contain a Mode pin (21). However, the mode pin on the deserializer determines the expected data format: RAW10, RAW12 LF, or RAW12 HF. Note that RAW12 LF is not supported on the DS90UB635-Q1.

7.5 Programming

7.5.1 I2C Interface Configuration

This serializer may be configured by the use of an I2C-compatible serial control bus. Multiple devices may share the serial control bus (up to two device addresses are supported). The device address is set through a resistor divider (R_{HIGH} and R_{IOW} – see Circuit to Bias IDX Pin) connected to the IDX pin.

7.5.1.1 IDX

The IDX pin configures the control interface to one of two possible device addresses—either the 1.8-V or 3.3-V referenced I2C address. A pull-up resistor and a pulldown resistor must be used to set the appropriate voltage on the IDX input pin (see below). The IDX resistor divider must be referred to Pin #25 (after the ferrite filter on the DS90UB635-Q1 pin side).

Table 7-11. IDX Configuration Setting

| IDX | V _{TARGET} VOLTAGE RANGE | | V _{IDX} TARGET VOLTAGE | SUGGESTED STRAP RESISTORS (1% TOL) | | I2C 8- BIT ADDRES | I2C 7- BIT ADDRE | V _(I2C) (I2C I/O VOLTAGE) | |
|-----|-----------------------------------|---------------------------------|---------------------------------------|---------------------------------------|------------------------|-------------------------|------------------------|---|-------|
| | RATIO MIN | RATIO TYP | RATIO MAX | V _{VDD} = 1.8 V | R _{HIGH} (kΩ) | R_{LOW} (k Ω) | S | SS | |
| 1 | 0 | 0 | 0.131 x V _(VDD18) | 0 | Open | 40.2 | 0x30 | 0x18 | 1.8 V |
| 2 | 0.178 x V _(VDD18) | 0.214 x V _(VDD18) | 0.256 x V _(VDD18) | 0.385 | 180 | 47.5 | 0x32 | 0x19 | 1.8 V |
| 3 | 0.537 x V _(VDD18) | 0.564 x V _(VDD18) | 0.591 x V _(VDD18) | 1.015 | 82.5 | 102 | 0x30 | 0x18 | 3.3 V |
| 4 | 0.652 x V _(VDD18) | 0.679 x V _(VDD18) | 0.706 x V _(VDD18) | 1.223 | 68.1 | 137 | 0x32 | 0x19 | 3.3 V |

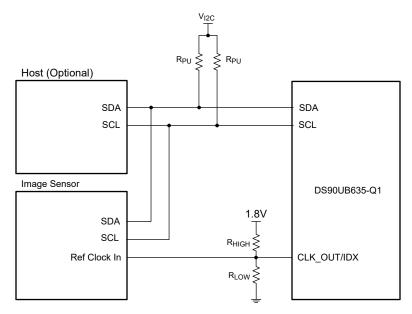

Figure 7-8. Circuit to Bias IDX Pin

7.5.2 I2C Interface Operation

The serial control bus consists of two signals: SCL and SDA. SCL is a Serial Bus Clock Input / Output signal and the SDA is the Serial Bus Data Input / Output signal. Both SCL and SDA signals require an external pullup resistor to V_{I2C} , chosen to be either 1.8 V or 3.3 V.

For the standard and fast I2C modes, a pullup resistor of R_{PU} = 4.7 k Ω is recommended, while a pullup resistor of R_{PU} = 470 Ω is recommended for the fast plus mode. However, the pullup resistor value may be additionally adjusted for capacitive loading and data rate requirements. The signals are either pulled High or driven Low. The

TEXAS INSTRUMENTS www.ti.com

IDX pin configures the control interface to one of two possible device addresses. A pullup resistor (R_{HIGH}) and a pulldown resistor (R_{LOW}) may be used to set the appropriate voltage on the IDX input pin.

The Serial Bus protocol is controlled by START, START-Repeated, and STOP phases. A START occurs when SDA transitions Low while SCL is High. A STOP occurs when SDA transitions High while SCL is also HIGH. See Figure 7-9.

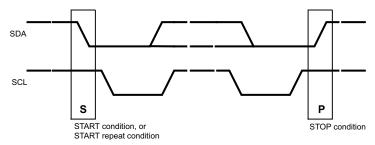

Figure 7-9. Start and Stop Conditions

To communicate with an I2C target, the host controller (controller) sends data to the target address and waits for a response. This response is referred to as an acknowledge bit (ACK). If a target on the bus is addressed correctly, the target Acknowledges (ACKs) the controller by driving the SDA bus low. If the address does not match a target address of the device, the target Not-acknowledges (NACKs) the controller by pulling the SDA High. ACKs also occur on the bus when data is being transmitted. When the controller is writing data, the target ACKs after every data byte is successfully received. When the controller is reading data, the controller ACKs after every data byte is received to let the target know that the controller wants to receive another data byte. When the controller wants to stop reading, the controller NACKs after the last data byte and creates a stop condition on the bus. All communication on the bus begins with either a start condition or a repeated start condition. All communication on the bus ends with a stop condition. A READ is shown in Figure 7-10 and a WRITE is shown in Figure 7-11.

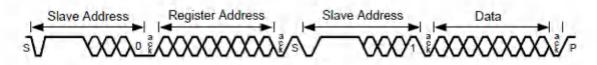

Figure 7-10. I2C Bus Read

Figure 7-11. I2C Bus Write

Any I2C controller located at the serializer must support I2C clock stretching. For more information on I2C interface requirements and throughput considerations, refer to the TI application note *I2C communication over FPD-Link III with bidirectional control channel* (SNLA131).

7.5.3 I2C Timing

The proxy controller timing parameters are based on the internal reference clock. The I2C controller regenerates the I2C read or write access using timing controls in registers 0x0B and 0x0C to regenerate the clock and data signals to meet the desired I2C timing in standard, fast, or fast-plus modes of operation.

I2C controller SCL high time is set in register 0x0B. This field configures the high pulse width of the SCL output when the serializer is the controller on the local I2C bus. The default value is set to provide a minimum 5- μ s SCL high time with the internal reference clock at 26.25 MHz including five additional oscillator clock periods or synchronization and response time. Units are 38.1 ns for the nominal oscillator clock frequency, giving Min_delay = 38.1 ns × (SCL_HIGH_TIME + 5).

I2C controller SCL low time is set in register 0x0C. This field configures the low pulse width of the SCL output when the serializer is the controller on the local deserializer I2C bus. This value is also used as the SDA setup time by the I2C target for providing data prior to releasing SCL during accesses over the bidirectional control channel. The default value is set to provide a minimum 5- μ s SCL high time with the reference clock at 26.25 MHz including five additional oscillator clock periods or synchronization and response time. Units are 38.1 ns for the nominal oscillator clock frequency, giving Min_delay = 38.1 ns × (SCL_HIGH_TIME + 5). See Table 7-12 example settings for standard mode, fast mode, and fast mode plus timing.

Table 7-12. Typical I2C Timing Register Settings

| I2C MODE | SCL HIGH | TIME | SCL LOW TIME | | |
|-------------|----------|---------------|--------------|---------------|--|
| IZC WODE | 0x0B | NOMINAL DELAY | 0x0C | NOMINAL DELAY | |
| Standard | 0x7F | 5.03 µs | 0x7F | 5.03 µs | |
| Fast | 0x13 | 0.914 µs | 0x26 | 1.64 µs | |
| Fast - Plus | 0x06 | 0.419 μs | 0x0B | 0.648 µs | |

7.6 Pattern Generation

The DS90UB635-Q1 supports an internal pattern generation feature to provide a simple way to generate video test patterns for the CSI-2 transmitter outputs. Two types of patterns are supported: Reference color bar patterns and fixed color patterns accessed by the pattern generator page 0 in the indirect register set.

7.6.1 Reference Color Bar Pattern

The reference color bar patterns are based on the pattern defined in Appendix D of the mipi_CTS_for_D-PHY_v1-1_r03 specification. The pattern is an 8-color bar pattern designed to provide high, low, and medium frequency outputs on the CSI-2 transmit data lanes.

The CSI-2 reference pattern provides 8 color bars by default with the following byte data for the color bars: X bytes of 0xAA (high-frequency pattern, inverted), X bytes of 0x33 (mid-frequency pattern), X bytes of 0xF0 (low-frequency pattern, inverted), X bytes of 0x7F (lone 0 pattern), X bytes of 0x55 (high-frequency pattern), X bytes of 0xCC (mid-frequency pattern, inverted), X bytes of 0x0F (low-frequency pattern), and Y bytes of 0x80 (long 1 pattern). In most cases, Y will be the same as X. For certain data types, the last color bar may need to be larger than the others to properly fill the video line dimensions.

The pattern generator is programmable with the following options:

- Number of color bars (1, 2, 4, or 8)
- Number of bytes per line
- · Number of bytes per color bar
- CSI-2 datatype field and VC-ID
- · Number of active video lines per frame
- · Number of total lines per frame (active plus blanking)
- Line period (possibly program in units of 10 ns)
- Vertical front porch number of blank lines prior to the FrameEnd packet
- Vertical back porch number of blank lines following the FrameStart packet

The pattern generator relies on proper programming by software to ensure the color bar widths are set to multiples of the block (or word) size required for the specified datatype. For example, for RGB888, the block size is 3 bytes which also matches the pixel size. In this case, the number of bytes per color bar must be a multiple of 3. The pattern generator is implemented in the CSI-2 transmit clock domain, providing the pattern directly to the CSI-2 transmitter. The circuit generates the CSI-2 formatted data.

7.6.2 Fixed Color Patterns

When programmed for fixed color pattern mode, the pattern generator can generate a video image with a programmable fixed data pattern. The basic programming fields for image dimensions are the same as used with the color bar patterns. When sending fixed color patterns, the color bar controls allow the user to alternate between the fixed pattern data and the bit-wise inverse of the fixed pattern data.

The fixed color patterns assume a fixed block size for the byte pattern. The block size is programmable through a register and is designed to support most 8-bit, 10-bit, and 12-bit pixel formats. The block size should be set based on the pixel size converted to blocks that are an integer multiple of bytes. For example, an RGB888 pattern would consist of 3-byte pixels and would therefore require a 3-byte block size. A 2x12-bit pixel image would also require 3-byte block size, while a 3x12-bit pixel image would require 9 bytes (2 pixels) to send an integer number of bytes. Sending a RAW10 pattern typically requires a 5-byte block size for 4 pixels, so 1x10-bit and 2x10-bit could both be sent with a 5-byte block size. For 3x10-bit, a 15-byte block size would be required.

The fixed color patterns support block sizes up to 16 bytes in length, allowing additional options for patterns in some conditions. For example, an RGB888 image could alternate between four different pixels by using a twelve-byte block size. An alternating black and white RGB888 image could be sent with a block size of 6-bytes by setting the first three bytes to 0xFF and the next three bytes to 0x00.

To support up to 16-byte block sizes, a set of sixteen registers are implemented to allow programming the value for each data byte.

7.6.3 Packet Generator Programming

The information in this section provides details on how to program the pattern generator to provide a specific color bar pattern, based on datatype, frame size, and line size.

Most basic configuration information is determined directly from the expected video frame parameters. The requirements should include the datatype, frame rate (frames per second), number of active lines per frame, number of total lines per frame (active plus blanking), and number of pixels per line.

- PGEN_ACT_LPF Number of active lines per frame
- PGEN_TOT_LPF Number of total lines per frame
- PGEN_LSIZE Video line length size in bytes. Compute based on pixels per line multiplied by pixel size in bytes
- CSI-2 DataType field and VC-ID.
- Optional: PGEN_VBP Vertical back porch. This is the number of lines of vertical blanking following Frame Valid
- Optional: PGEN_VFP Vertical front porch. This is the number of lines of vertical blanking preceding Frame Valid.
- PGEN LINE PD Line period in 10-ns units. Compute based on Frame Rate and total lines per frame.
- PGEN_BAR_SIZE Color bar size in bytes. Compute based on datatype and line length in bytes (see details below).

7.6.3.1 Determining Color Bar Size

The color bar pattern should be programmed in units of a block or word size dependent on the datatype of the video being sent. The sizes are defined in the MIPI CSI-2 specification. For example, RGB888 requires a 3-byte block size which is the same as the pixel size. RAW10 requires a 5-byte block size which is equal to 4 pixels. RAW12 requires a 3-byte block size which is equal to 2 pixels.

When programming the Pattern Generator, software should compute the required bar size in bytes based on the line size and the number of bars. For the standard 8-color bar pattern, that would require the following algorithm:

- Select the desired datatype, and a valid length for that datatype (in pixels).
- Convert pixels/line to blocks/line (by dividing by the number of pixels/block, as defined in the datatype specification).
- Divide the blocks/line result by the number of color bars (8), giving blocks/bar.
- Round result down to the nearest integer.
- Convert blocks/bar to bytes/bar and program that value into the PGEN_BAR_SIZE register.

As an alternative, the blocks/line can be computed by converting pixels/line to bytes/line and dividing by bytes/block.

7.7 Register Maps

In the register definitions under the TYPE and DEFAULT heading, the following definitions apply:

- R = Read only access
- R/W = Read / Write access
- R/RC = Read only access, Read to Clear
- (R/W)/SC = Read / Write access, Self-Clearing bit
- (R/W)/S = Read / Write access, Set based on strap pin configuration at start-up
- LL = Latched Low and held until read
- LH = Latched High and held until read
- S = Set based on strap pin configuration at start-up

7.7.1 I2C Device ID Register

Table 7-13. Device ID Register (Address 0x00)

| BIT | FIELD | TYPE | DEFAULT | DESCRIPTION |
|-----|-----------------|--------|---------|--|
| 7:1 | DEVICE_ID | S, R/W | | 7-bit I2C ID of Serializer. This field always indicates the current value of the I2C ID. When bit 0 of this register is 0, this field is read-only and shows the strapped ID. When bit 0 of this register is 1, this field is read/write and can be used to assign any valid I2C ID. |
| 0 | SER_ID_OVERRIDE | R/W | 0x0 | Device ID is from strap Register I2C Device ID overrides strapped value |

7.7.2 Reset

Table 7-14. RESET_CTL Register (Address 0x01)

| 4 | MODE_OV | R/W | 0x0 | Serializer Mode from the strapped MODE pin Register Mode overrides strapped value |
| 3 | MODE_DONE | R | 0x0 | Indicates MODE value has stabilized and been latched. |
| 2:0 | MODE | S, R/W | S | This field always indicates the MODE setting of the device. When bit 4 of this register is 0, this field is read-only and shows the Mode Setting. When bit 4 of this register is 1, this field is read/write and can be used to assign MODE. Mode is latched from strap value when PDB transitions LOW to HIGH. Mode of operation: 000: CSI-2 Synchronous Mode 001: Reserved 010: CSI-2 Non-synchronous external clock Mode (Requires a local clock source) 011: CSI-2 Non-synchronous Internal AON Clock 101: DVP External Clock Backward-Compatible Mode (Requires local clock source) |

7.7.5 BC_MODE_SELECT

Table 7-17. BC_MODE_SELECT (Address 0x04)

| BIT | FIELD | TYPE | DEFAULT | DESCRIPTION | | |
|-----|-------------------------|------|---------|--|--|--|
| 7:3 | RESERVED | R/W | 0x0 | Reserved. | | |
| 2 | MODE_OVERWRITE _100m | R/W | 0x0 | 28-bit RAW 10 Mode operation. Backward-compatible RAW 10 DVP mode (28-bit) is automatically configured by the Bidirectional Control Channel once RX lock has been detected. Software may overwrite the value, but must also set the DVP_MODE_OVER_EN to prevent overwriting by the Bidirectional Control Channel. | | |
| 1 | MODE_OVERWRITE _75m | R/W | 0x0 | 28-bit RAW 12 Mode operation. Backward-compatible RAW 12 HF DVP mode (28-bit) is automatically configured by the Bidirectional Control Channel once RX lock has been detected. Software may overwrite the value, but must also set the DVP_MODE_OVER_EN to prevent overwriting by the Bidirectional Control Channel. | | |
| 0 | DVP_MODE_OVER_ EN | R/W | 0x0 | Prevent auto-loading of the backward-compatible DVP mode (28-bit) operation by the Bidirectional Control Channel. | | |

7.7.6 PLL Clock Control

Table 7-18. PLLCLK_CTRL Register (Address 0x05)

| BIT | FIELD | TYPE | DEFAULT | DESCRIPTION |
|-----|------------|------|---------|--|
| 7 | RESERVED | R/W | 0x0 | Reserved. |
| 6:4 | CLKIN_DIV | R/W | 0x0 | CLKIN clock divide ratio to generate internal reference. 3'b000: CLKIN Div by 1 3'b001: CLKIN Div by 2 3'b010: CLKIN Div by 4 3'b011: CLKIN Div by 8 3'b100 - 3'b111: RESERVED |
| 3 | OSCCLK_SEL | R/W | 0x0 | Internally generated OSC clock reference when operating with Non-Synchronous internal clock or external system clock not detected. 0: 24.2 MHz to 25.5 MHz, set for 2 Gbps line rate 1: 48.4 MHz to 51 MHz, set for 4 Gbps line rate mode. |
| 2:0 | RESERVED | R/W | 0x3 | Reserved. |

7.7.7 Clock Output Control 0

The DS90UB635-Q1 provides an option for a programmable reference output clock to meet the system clock input requirements of various sensors. The control of the clock output frequency is set by the input divider and M value in register 0x06 and the N value in register 0x07.

Table 7-19. CLKOUT_CTRL0 (Address 0x06)

| BIT | FIELD | TYPE | DEFAULT | DESCRIPTION |
|-----|------------|------|---------|--|
| 7:5 | HS_CLK_DIV | R/W | 0x2 | Clock source of M/N divider is based on the forward channel data rate divided by this register field. 000: Div by 1 001: Div by 2 010: Div by 4 011: Div by 8 100: Div by 16 |
| 4:0 | DIV_M_VAL | R/W | 0x01 | M value for M/N divider for CLKOUT. CLKOUT can be programmed using the M/N ratio of an internal high-speed clock to generate a clock output based on the system sensor requirement. When selecting the M/N ratio, they should be set to yield the CLKOUT frequency less than 100 MHz. The M value should be ≥ 0. Setting M to 0 will disable CLKOUT and output will remain static high or low. |

7.7.8 Clock Output Control 1

The DS90UB635-Q1 provides option for a programmable reference output clock to meet the system clock input requirements of various sensors. The control of the clock output frequency is set by the input divider and M value in register 0x06 and the N value in register 0x07.

Table 7-20. CLKOUT_CTRL1 (Address 0x07)

| BIT | FIELD | TYPE | DEFAULT | DESCRIPTION |
|-----|-----------|------|---------|--|
| 7:0 | DIV_N_VAL | R/W | 0x28 | N value for M/N divider for CLKOUT. CLKOUT can be programmed using the M/N ratio of an internal high-speed clock to generate a clock output based on the system sensor requirement. When selecting the M/N ratio, they should be set to yield the CLKOUT frequency less than 100 MHz. N must be set to non-zero value. |

7.7.9 Back Channel Watchdog Control

Table 7-21. BCC_WATCHDOG (Address 0x08)

| BIT | FIELD | TYPE | DEFAULT | DESCRIPTION |
|-----|--------------------------|------|---------|--|
| 7:1 | BCC_WD_TIMER | R/W | 0x7F | BCC_WD_TIMER sets the Bidirectional Control Channel Watchdog Timeout value in units of 2 milliseconds. This field should not be set to 0. The watchdog timer allows termination of a control channel transaction if it fails to complete within a programmed amount of time. |
| 0 | BCC_WD_TIMER_ DISABLE | R/W | 0x0 | Disable Bidirectional Control Channel Watchdog Timer. 1: Disables BCC Watchdog Timer operation 0: Enables BCC Watchdog Timer operation |

7.7.10 I2C Control 1

Table 7-22. I2C_CONTROL1 (Address 0x09)

| BIT | FIELD | TYPE | DEFAULT | DESCRIPTION |
|-----|-----------------------|------|---------|--|
| 7 | LCL_WRITE_ DISABLE | R/W | 0x0 | Disable Remote Writes to Local Registers. Setting this bit to a 1 prevents remote writes to local device registers from across the control channel. This prevents writes to the Serializer registers from an I2C controller attached to the deserializer. Setting this bit does not affect remote access to I2C targets at the Serializer. |
| 6:4 | I2C_SDA_HOLD | R/W | 0x1 | Internal SDA Hold Time. This field configures the amount of internal hold time provided for the SDA input relative to the SCL input. Units are 50 nanoseconds. |
| 3:0 | I2C_FILTER_DEPTH | R/W | 0xE | I2C Glitch Filter Depth. This field configures the maximum width of glitch pulses on the SCL and SDA inputs that are rejected. Units are 5 nanoseconds. |

7.7.11 I2C Control 2

Table 7-23. I2C_CONTROL2 (Address 0x0A)

| BIT | FIELD | TYPE | DEFAULT | DESCRIPTION |
|-----|---------------------------|------|---------|---|
| 7:4 | SDA_OUTPUT_ SETUP | R/W | 0x1 | Remote Ack SDA Output Setup. When a Control Channel (remote) access is active, this field configures setup time from the SDA output relative to the rising edge of SCL during ACK cycles. Setting this value increases setup time in units of 640 ns. The nominal output setup time value for SDA to SCL when this field is 0 is 80 ns. |
| 3:2 | SDA_OUTPUT_DELA Y | R/W | 0x0 | SDA Output Delay. This field configures additional delay on the SDA output relative to the falling edge of SCL. Setting this value increases output delay in units of 40 ns. Nominal output delay values for SCL to SDA are: 00 : 240 ns 01: 280 ns 10: 320 ns 11: 360 ns |
| 1 | I2C_BUS_TIMER_ SPEEDUP | R/W | 0x0 | Speed up I2C Bus Watchdog Timer. 1: Watchdog Timer expires after approximately 50 microseconds 0: Watchdog Timer expires after approximately 1 second. |
| 0 | I2C_BUS_TIMER_ DISABLE | R/W | 0x0 | Disable I2C Bus Watchdog Timer. When the I2C Bus Watchdog Timer may be used to detect when the I2C bus is free or hung up following an invalid termination of a transaction. If SDA is high and no signalling occurs for approximately 1 second, the I2C bus is assumed free. If SDA is low and no signaling occurs, the device attempts to clear the bus by driving 9 clocks on SCL. |

Product Folder Links: DS90UB635-Q1

7.7.12 SCL High Time

Table 7-24. SCL_HIGH_TIME (Address 0x0B)

| BIT | FIELD | TYPE | DEFAULT | DESCRIPTION |
|-----|---------------|------|---------|---|
| 7:0 | SCL_HIGH_TIME | R/W | 0x7F | I2C Controller SCL High Time. This field configures the high pulse width of the SCL output when the Serializer is the Controller on the local I2C bus. Units are 38.1 ns for the nominal oscillator clock frequency of 26.25 MHz. The default value is set to provide a minimum 5-µs SCL high time with the internal oscillator clock running at 26.25 MHz. Delay includes 5 additional oscillator clock periods. Min_delay = 38.0952 ns × (SCL_HIGH_TIME + 5) |

7.7.13 SCL Low Time

Table 7-25. SCL_LOW_TIME (Address 0x0C)

| BIT | FIELD | TYPE | DEFAULT | DESCRIPTION |
|-----|--------------|------|---------|---|
| 7:0 | SCL_LOW_TIME | R/W | 0x7F | I2C SCL Low Time. This field configures the low pulse width of the SCL output when the Serializer is the Controller on the local I2C bus. This value is also used as the SDA setup time by the I2C Target for providing data prior to releasing SCL during accesses over the Bidirectional Control Channel. Units are 38.1 ns for the nominal oscillator clock frequency of 26.25 MHz. The default value is set to provide a minimum 5-µs SCL low time with the internal oscillator clock running at 26.25 MHz. Delay includes 5 additional clock periods. Min_delay = 38.0952 ns × (SCL_LOW_TIME + 5) |

7.7.14 Local GPIO DATA

Table 7-26. LOCAL_GPIO_DATA (Address 0x0D)

| BIT | FIELD | TYPE | DEFAULT | DESCRIPTION |
|-----|--------------|------|---------|---|
| 7:4 | GPIO_RMTEN | R/W | 0xF | Enable remote deserializer GPIO data on local GPIO. Bit 7: Enable remote GPIO3 when this bit is set to 1 Bit 6: Enable remote GPIO2 when this bit is set to 1 Bit 5: Enable remote GPIO1 when this bit is set to 1 Bit 4: Enable remote GPIO0 when this bit is set to 1 |
| 3:0 | GPIO_OUT_SRC | R/W | 0x0 | GPIO Output Source. This register sets the logical output of 4 GPIOs, GPIO_RMTEN must be disabled and GPIOx_OUT_EN must be enabled. Bit 3: write 0/1 on GPIO3 Bit 2: write 0/1 on GPIO2 Bit 1: write 0/1 on GPIO1 Bit 0: write 0/1 on GPIO0 |

7.7.15 GPIO Input Control

Table 7-27. GPIO_INPUT_CTRL (Address 0x0E)

| | 14515 / 271 51 15_111 51_51112 (/1441555 5X52) | | | | | | | |

| 7 | GPIO3_OUT_EN | R/W | 0x0 | GPIO3 Output Enable. 0: Disabled 1: Enabled | | | | |
| 6 | GPIO2_OUT_EN | R/W | 0x0 | GPIO2 Output Enable. 0: Disabled 1: Enabled | | | | |
| 5 | GPIO1_OUT_EN | R/W | 0x0 | GPIO1 Output Enable. 0: Disabled 1: Enabled | | | | |
| 4 | GPIO0_OUT_EN | R/W | 0x0 | GPIO0 Output Enable. 0: Disabled 1: Enabled | | | | |

Table 7-27. GPIO_INPUT_CTRL (Address 0x0E) (continued)

| BIT | FIELD | TYPE | DEFAULT | DESCRIPTION |
|-----|----------------|------|---------|--|
| 3 | GPIO3_INPUT_EN | R/W | 0x1 | GPIO3 Input Enable. 0: Disabled 1: Enabled |
| 2 | GPIO2_INPUT_EN | R/W | 0x1 | GPIO2 Input Enable. 0: Disabled 1: Enabled |
| 1 | GPIO1_INPUT_EN | R/W | 0x1 | GPIO1 Input Enable. 0: Disabled 1: Enabled |
| 0 | GPIO0_INPUT_EN | R/W | 0x1 | GPIO0 Input Enable. 0: Disabled 1: Enabled |

7.7.16 DVP_CFG

Table 7-28. DVP_CFG (Address 0x10)

| BIT | FIELD | TYPE | DEFAULT | DESCRIPTION | | | |
|-----|-----------------|------|---------|---|--|--|--|
| 7:5 | RESERVED | R/W | 0x0 | Reserved. | | | |
| 4 | DVP_DT_ANY_EN | R/W | 0x0 | When asserted, allows any packet with a Long data type (DT) packet through DVP. | | | |
| 3 | DVP_DT_MATCH_EN | R/W | 0x0 | When asserted, allows data type matching based on the value in the DVP_DT register. Note: When this bit is asserted, writes to the DVP_DT register are blocked. | | | |
| 2 | DVP_DT_YUV_EN | R/W | 0x0 | When asserted, allows YUV 10-bit DTs through DVP when mode_100m is also asserted (YUV 10-bit DTs are 0x19, 0x1d, and 0x1f). | | | |
| 1 | DVP_FV_IN | R/W | 0x0 | Invert Frame Valid Polarity. | | | |
| 0 | DVP_LV_INV | R/W | 0x0 | Invert Line Valid Polarity. | | | |

7.7.17 DVP_DT

Table 7-29. DVP_DT (Address 0x11)

| | | | _ | , |
|-----|-----------------|------|---------|--|
| BIT | FIELD | TYPE | DEFAULT | DESCRIPTION |
| 7:6 | RESERVED | R/W | 0x0 | Reserved. |
| 5:0 | DVP_DT_MATCH_VA | R/W | 0x0 | When the DVP_DT_MATCH_EN bit in register DVP_CFG (0x10) is asserted, the DVP block will allow packets with this DT through regardless of the mode_75m or mode_100m setting. The DT value must be a Long DT value (either bit 5 or 4 must be set) for a match to occur. |

7.7.18 Force BIST Error

Table 7-30. FORCE_BIST_ERR (Address 0x13)

| BIT | FIELD | TYPE | DEFAULT | DESCRIPTION |
|-----|--------------|------|---------|--|
| 7 | FORCE_FC_ERR | SC | 0x0 | FORCE_ERR_CNT allows forcing a number of forward channel parity errors based on the value in FORCE_FC_CNT. When in BIST mode, the parity errors will be generated automatically upon entering BIST mode. When in normal operation this bit must be set to one to inject the parity errors. 0: Force Disabled 1: Force Enabled |
| 6:0 | FORCE_FC_CNT | R/W | 0x00 | Force Error Count. Set this value to the desired number of forced parity errors. |

Product Folder Links: DS90UB635-Q1

7.7.19 Remote BIST Control

Table 7-31. REMOTE_BIST_CTRL (Address 0x14)

| BIT | FIELD | TYPE | DEFAULT | DESCRIPTION |

|-----|----------------------------------|------|---------|---|
| 7 | I2C_PASS_ THROUGH_ALL | R/W | 0x0 | I2C Pass-Through All Transactions. 0: Disabled 1: Enabled |
| 6 | I2C_PASS_ THROUGH | R/W | 0x0 | I2C Pass-Through to Deserializer if decode matches. 0: Pass-Through Disabled 1: Pass-Through Enabled |
| 5 | AUTO_ACK_ALL | R/W | 0x0 | Automatically Acknowledge all I2C writes independent of the forward channel lock state or status of the remote Acknowledge. 1: Enable 0: Disable |
| 4 | RESERVED | R/W | 0x0 | Reserved. |
| 3 | RX_PARITY_ CHECKER_ ENABLE | R/W | 0x1 | Parity Checker Enable. 0: Disable 1: Enable |
| 2 | RESERVED | R/W | 0x0 | Reserved. |
| 1 | RESERVED | R/W | 0x0 | Reserved. |
| 0 | RESERVED | R/W | 0x1 | Reserved. |

7.7.37 Datapath Control 1

Table 7-49. DATAPATH_CTL1 (Address 0x33)

| BIT | FIELD | TYPE | DEFAULT | DESCRIPTION |
|-----|------------|------|---------|---|
| 7:3 | RESERVED | R/W | 0x00 | Reserved. |
| 2 | DCA_CRC_EN | R/W | 0x1 | DCA CRC Enable. If set to a 1, the Forward Channel sends a CRC as part of the DCA sequence. The DCA CRC protects the first 8 bytes of the DCA sequence. The CRC is sent as the 9th byte. |
| 1:0 | FC_GPIO_EN | R/W | 0x0 | Forward Channel GPIO Enable. Configures the number of enabled forward channel GPIOs. 00: GPIOs disabled 01: One GPIO 10: Two GPIOs 11: Four GPIOs |

7.7.38 Remote Partner Capabilities 1

Table 7-50. REMOTE_PAR_CAP1 (Address 0x35)

| BIT | FIELD | TYPE | DEFAULT | DESCRIPTION |
|-----|--------------------|------|---------|--|
| 7 | FREEZE_DES_ CAP | R/W | 0x0 | Freeze Partner Capabilities. Prevent auto-loading of the Partner Capabilities by the Bidirectional Control Channel. The Capabilities are frozen at the values written in registers 0x1E and 0x1F. |
| 6 | RESERVED | R/W | 0x0 | Reserved. |
| 5 | BIST_EN | R/W | 0x0 | Link BIST Enable. This bit indicates the remote partner is requesting BIST operation over the FPD-Link III interface. This field is automatically configured by the Bidirectional Control Channel once back channel link has been detected. Software may overwrite this value, but must also set the FREEZE_DES_CAP bit to prevent overwriting by the Bidirectional Control Channel. |

Table 7-50. REMOTE_PAR_CAP1 (Address 0x35) (continued)

| BIT | FIELD | TYPE | DEFAULT | DESCRIPTION |
|-----|----------|------|---------|---|
| 4 | MPORT | R/W | 0x0 | Remote Partner Multi-Port capable. 0 : Remote partner is a single-port deserializer device 1 : Remote partner is a multi-port deserializer device This field is automatically configured by the Bidirectional Control Channel once back channel link has been detected. Software may overwrite this value, but must also set the FREEZE_DES_CAP bit to prevent overwriting by the Bidirectional Control Channel. |
| 3:0 | PORT_NUM | R/W | 0x0 | Remote Partner port number. When connected to a multi-port device, this field indicates the port number to which the Serializer is connected. This field is automatically configured by the Bidirectional Control Channel once back channel link has been detected. Software may overwrite this value, but must also set the FREEZE_DES_CAP bit to prevent overwriting by the Bidirectional Control Channel. |

7.7.39 Partner Deserializer ID

Table 7-51. DES_ID (Address 0x37)

| BIT | FIELD | TYPE | DEFAULT | DESCRIPTION |
|-----|----------------------|------|---------|---|
| 7:1 | DES_ID | R/W | 0x3D | Remote Deserializer ID. This field is normally loaded automatically from the remote Deserializer. |
| 0 | FREEZE_ DEVICE_ID | R/W | | Freeze Deserializer Device ID. Prevent auto-loading of the Deserializer Device ID from the back channel. The ID is frozen at the value written. |

7.7.40 Target 0 ID

Table 7-52. TARGET_ID_0 (Address 0x39)

| _ | | | | | |
|---|-----|-------------|------|---------|--|
| | BIT | FIELD | TYPE | DEFAULT | DESCRIPTION |
| | 7:1 | TARGET_ID_0 | R/W | 0x00 | 7-bit Remote Target Device ID 0. Configures the physical I2C address of the remote I2C Target device attached to the remote Deserializer. If an I2C transaction is addressed to the Target Alias ID0, the transaction is remapped to this address before passing the transaction across the Bidirectional Control Channel to the Deserializer. |
| | 0 | RESERVED | R | 0x0 | Reserved. |

7.7.41 Target 1 ID

Table 7-53. TARGET_ID_1 (Address 0x3A)

| | BIT | FIELD | TYPE | DEFAULT | DESCRIPTION |
|---|-----|-------------|------|---------|--|
| | 7:1 | TARGET_ID_1 | R/W | 0x00 | 7-bit Remote Target Device ID 1. Configures the physical I2C address of the remote I2C Target device attached to the remote Deserializer. If an I2C transaction is addressed to the Target Alias ID1, the transaction is remapped to this address before passing the transaction across the Bidirectional Control Channel to the Deserializer. |
| Γ | 0 | RESERVED | R | 0x0 | Reserved. |

7.7.42 Target 2 ID

Table 7-54. TARGET_ID_2 (Address 0x3B)

| _ | | | | | |
|---|-----|-------------|------|---------|--|
| | BIT | FIELD | TYPE | DEFAULT | DESCRIPTION |
| | 7:1 | TARGET_ID_2 | R/W | 0×00 | 7-bit Remote Target Device ID 2. Configures the physical I2C address of the remote I2C Target device attached to the remote Deserializer. If an I2C transaction is addressed to the Target Alias ID2, the transaction is remapped to this address before passing the transaction across the Bidirectional Control Channel to the Deserializer. |

Table 7-54. TARGET_ID_2 (Address 0x3B) (continued)

7.7.43 Target 3 ID

Table 7-55. TARGET_ID_3 (Address 0x3C)

| _ | | | | | |
|---|-----|-------------|------|---------|--|
| | BIT | FIELD | TYPE | DEFAULT | DESCRIPTION |
| | 7:1 | TARGET_ID_3 | R/W | 0x00 | 7-bit Remote Target Device ID 3. Configures the physical I2C address of the remote I2C Target device attached to the remote Deserializer. If an I2C transaction is addressed to the Target Alias ID3, the transaction is remapped to this address before passing the transaction across the Bidirectional Control Channel to the Deserializer. |
| | 0 | RESERVED | R | 0x0 | Reserved. |

7.7.44 Target 4 ID

Table 7-56. TARGET_ID_4 (Address 0x3D)

| BIT | FIELD | TYPE | DEFAULT | DESCRIPTION |
|-----|-------------|------|---------|--|
| 7:1 | TARGET_ID_4 | R/W | 0x00 | 7-bit Remote Target Device ID 4. Configures the physical I2C address of the remote I2C Target device attached to the remote Deserializer. If an I2C transaction is addressed to the Target Alias ID4, the transaction is remapped to this address before passing the transaction across the Bidirectional Control Channel to the Deserializer. |
| 0 | RESERVED | R | 0x0 | Reserved. |

7.7.45 Target 5 ID

Table 7-57. TARGET_ID_5 (Address 0x3E)

| BIT | FIELD | TYPE | DEFAULT | DESCRIPTION |
|-----|-------------|------|---------|--|
| 7:1 | TARGET_ID_5 | R/W | 0x00 | 7-bit Remote Target Device ID 5. Configures the physical I2C address of the remote I2C Target device attached to the remote Deserializer. If an I2C transaction is addressed to the Target Alias ID5, the transaction is remapped to this address before passing the transaction across the Bidirectional Control Channel to the Deserializer. |
| 0 | RESERVED | R | 0x0 | Reserved. |

7.7.46 Target 6 ID

Table 7-58. TARGET_ID_6 (Address 0x3F)

| BIT | FIELD | TYPE | DEFAULT | DESCRIPTION |
|-----|-------------|------|---------|--|
| 7:1 | TARGET_ID_6 | R/W | 0x00 | 7-bit Remote Target Device ID 6. Configures the physical I2C address of the remote I2C Target device attached to the remote Deserializer. If an I2C transaction is addressed to the Target Alias ID6, the transaction is remapped to this address before passing the transaction across the Bidirectional Control Channel to the Deserializer. |
| 0 | RESERVED | R | 0x0 | Reserved. |

7.7.47 Target 7 ID

Table 7-59. TARGET_ID_7 (Address 0x40)

| BIT | FIELD | TYPE | DEFAULT | DESCRIPTION |
|-----|-------------|------|---------|--|
| 7:1 | TARGET_ID_7 | R/W | 0x00 | 7-bit Remote Target Device ID 7. Configures the physical I2C address of the remote I2C Target device attached to the remote Deserializer. If an I2C transaction is addressed to the Target Alias ID7, the transaction is remapped to this address before passing the transaction across the Bidirectional Control Channel to the Deserializer. |

Table 7-59. TARGET_ID_7 (Address 0x40) (continued)

| 0 | RESERVED | R | 0x0 | Reserved. |

7.7.48 Target 0 Alias

Table 7-60. TARGET_ID_ALIAS_0 (Address 0x41)

| BIT | FIELD | TYPE | DEFAULT | DESCRIPTION |
|-----|-----------------------|------|---------|---|
| 7:1 | TARGET_ID_ ALIAS_0 | R/W | 0x00 | 7-bit Remote Target Device Alias ID 0. Configures the decoder for detecting transactions designated for an I2C Target device attached to the remote Deserializer. The transaction is remapped to the address specified in the Target ID0 register. A value of 0 in this field disables access to the remote I2C Target. |
| 0 | TARGET_AUTO_ ACK_0 | R/W | 0x0 | Automatically Acknowledge all I2C writes to the remote Target 0 independent of the forward channel lock state or status of the remote Deserializer Acknowledge. 1: Enable 0: Disable This is intended for debugging only and not recommended for normal operation. |

7.7.49 Target 1 Alias

Table 7-61. TARGET_ID_ALIAS_1 (Address 0x42)

| BIT | FIELD | TYPE | DEFAULT | DESCRIPTION |
|-----|-----------------------|------|---------|---|
| 7:1 | TARGET_ID_ALIA S_1 | R/W | 0x00 | 7-bit Remote Target Device Alias ID 1. Configures the decoder for detecting transactions designated for an I2C Target device attached to the remote Deserializer. The transaction is remapped to the address specified in the Target ID1 register. A value of 0 in this field disables access to the remote I2C Target. |
| 0 | TARGET_AUTO_ ACK_1 | R/W | 0x0 | Automatically Acknowledge all I2C writes to the remote Target 1 independent of the forward channel lock state or status of the remote Deserializer Acknowledge. 1: Enable 0: Disable This is intended for debugging only and not recommended for normal operation. |

7.7.50 Target 2 Alias

Table 7-62. TARGET_ID_ALIAS_2 (Address 0x43)

| BIT | FIELD | TYPE | DEFAULT | DESCRIPTION |
|-----|-----------------------|------|---------|---|
| 7:1 | TARGET_ID_ALIA S_2 | R/W | 0x00 | 7-bit Remote Target Device Alias ID 2. Configures the decoder for detecting transactions designated for an I2C Target device attached to the remote Deserializer. The transaction is remapped to the address specified in the Target ID2 register. A value of 0 in this field disables access to the remote I2C Target. |
| 0 | TARGET_AUTO_ ACK_2 | R/W | 0x0 | Automatically Acknowledge all I2C writes to the remote Target 2 independent of the forward channel lock state or status of the remote Deserializer Acknowledge. 1: Enable 0: Disable This is intended for debugging only and not recommended for normal operation. |

7.7.51 Target 3 Alias

Table 7-63. TARGET_ID_ALIAS_3 (Address 0x44)

| BIT | FIELD | TYPE | DEFAULT | DESCRIPTION |
|-----|-----------------------|------|---------|---|
| 7:1 | TARGET_ID_ALIA S_3 | R/W | 0x00 | 7-bit Remote Target Device Alias ID 3. Configures the decoder for detecting transactions designated for an I2C Target device attached to the remote Deserializer. The transaction is remapped to the address specified in the Target ID3 register. A value of 0 in this field disables access to the remote I2C Target. |
| 0 | TARGET_AUTO_ ACK_3 | R/W | 0x0 | Automatically Acknowledge all I2C writes to the remote Target 3 independent of the forward channel lock state or status of the remote Deserializer Acknowledge. 1: Enable 0: Disable This is intended for debugging only and not recommended for normal operation. |

7.7.52 Target 4 Alias

Table 7-64. TARGET_ID_ALIAS_4 (Address 0x45)

| BIT | FIELD | TYPE | DEFAULT | DESCRIPTION |
|-----|-----------------------|------|---------|---|
| 7:1 | TARGET_ID_ALIA S_4 | R/W | 0x00 | 7-bit Remote Target Device Alias ID 4. Configures the decoder for detecting transactions designated for an I2C Target device attached to the remote Deserializer. The transaction is remapped to the address specified in the Target ID4 register. A value of 0 in this field disables access to the remote I2C Target. |
| 0 | TARGET_AUTO_ ACK_4 | R/W | 0x0 | Automatically Acknowledge all I2C writes to the remote Target 4 independent of the forward channel lock state or status of the remote Deserializer Acknowledge. 1: Enable 0: Disable This is intended for debugging only and not recommended for normal operation. |

7.7.53 Target 5 Alias

Table 7-65. TARGET_ID_ALIAS_5 (Address 0x46)

| BIT | FIELD | TYPE | DEFAULT | DESCRIPTION |
|-----|-----------------------|------|---------|---|
| 7:1 | TARGET_ID_ALIA S_5 | R/W | 0x00 | 7-bit Remote Target Device Alias ID 5. Configures the decoder for detecting transactions designated for an I2C Target device attached to the remote Deserializer. The transaction is remapped to the address specified in the Target ID5 register. A value of 0 in this field disables access to the remote I2C Target. |
| 0 | TARGET_AUTO_ ACK_5 | R/W | 0x0 | Automatically Acknowledge all I2C writes to the remote Target 5 independent of the forward channel lock state or status of the remote Deserializer Acknowledge. 1: Enable 0: Disable This is intended for debugging only and not recommended for normal operation. |

7.7.54 Target 6 Alias

Table 7-66. TARGET_ID_ALIAS_6 (Address 0x47)

| BIT | FIELD | TYPE | DEFAULT | DESCRIPTION |
|-----|-----------------------|------|---------|---|
| 7:1 | TARGET_ID_ALIA S_6 | R/W | 0x00 | 7-bit Remote Target Device Alias ID 6. Configures the decoder for detecting transactions designated for an I2C Target device attached to the remote Deserializer. The transaction is remapped to the address specified in the Target ID6 register. A value of 0 in this field disables access to the remote I2C Target. |

Table 7-66. TARGET_ID_ALIAS_6 (Address 0x47) (continued)

| BIT | FIELD | TYPE | DEFAULT | DESCRIPTION |
|-----|-----------------------|------|---------|---|
| 0 | TARGET_AUTO_ ACK_6 | R/W | 0x0 | Automatically Acknowledge all I2C writes to the remote Target 6 independent of the forward channel lock state or status of the remote Deserializer Acknowledge. 1: Enable 0: Disable This is intended for debugging only and not recommended for normal operation. |

7.7.55 Target 7 Alias

Table 7-67. TARGET_ID_ALIAS_7 (Address 0x48)

| BIT | FIELD | TYPE | DEFAUL T | DESCRIPTION |
|-----|-----------------------|------|-------------|---|
| 7:1 | TARGET_ID_ALIA S_7 | R/W | 0x00 | 7-bit Remote Target Device Alias ID 7. Configures the decoder for detecting transactions designated for an I2C Target device attached to the remote Deserializer. The transaction is remapped to the address specified in the Target ID7 register. A value of 0 in this field disables access to the remote I2C Target. |
| 0 | TARGET_AUTO_ ACK_7 | R/W | 0x0 | Automatically Acknowledge all I2C writes to the remote Target 7 independent of the forward channel lock state or status of the remote Deserializer Acknowledge. 1: Enable 0: Disable This is intended for debugging only and not recommended for normal operation. |

7.7.56 Back Channel Control

Table 7-68. BC_CTRL (Address 0x49)

| BIT | FIELD | TYPE | DEFAULT | DESCRIPTION |
|-----|----------------------|----------|---------|--|
| 7:6 | RESERVED | R | 0x0 | Reserved. |
| 5 | BIST_CRC_ERR_ CLR | (R/W)/SC | 0x0 | Clear BIST CRC error counter. 0: Disable clear 1: Enable Clear |
| 4 | RESERVED | R/W | 0x0 | Reserved. |
| 3 | CRC_ERR_CLR | (R/W)/SC | 0x0 | Clear CRC error. 0: Disable clear 1: Enable clear |
| 2:0 | LINK_DET_ TIMER | R/W | 0x0 | TX-RX link detect timer val. |

7.7.57 Revision ID

Table 7-69. REV_MASK_ID (Address 0x50)

| BIT | FIELD | TYPE | DEFAULT | DESCRIPTION |
|-----|-------------|------|---------|--------------|
| 7:4 | REVISION_ID | R | 0x2 | Revision ID. |
| 3:0 | MASK_ID | R | 0x0 | Mask ID. |

7.7.58 Device Status

Table 7-70. Device STS (Address 0x51)

| BIT | FIELD | TYPE | DEFAULT | DESCRIPTION |
|-----|-------------------|------|---------|---|
| 7 | CFG_CKSUM_ STS | R | 0x0 | Config Checksum Passed. This bit is set following initialization if the Configuration data in the eFuse ROM had a valid checksum. |

Table 7-70. Device STS (Address 0x51) (continued)

| BIT | FIELD | TYPE | DEFAULT | DESCRIPTION |
|-----|---------------|------|---------|--|
| 6 | CFG_INIT_DONE | R | 0x0 | Power-up initialization complete. This bit is set after Initialization is complete. Configuration from eFuse ROM has completed. |
| 5:0 | RESERVED | R | 0x00 | Reserved. |

7.7.59 General Status

Table 7-71. GENERAL_STATUS (Address 0x52)

| | Table 1-11. GENERAL_GTATOG (Address 0x02) | | | | | | |
|-----|---|------|---------|--|--|--|--|
| BIT | FIELD | TYPE | DEFAULT | DESCRIPTION | | | |
| 7 | RESERVED | R | 0x0 | Reserved. | | | |
| 6 | RX_LOCK_ DETECT | R | 0x0 | Deserializer LOCK status This bit indicates the LOCK status of the Deserializer. | | | |
| 5 | RESERVED | R | 0x0 | Reserved. | | | |
| 4 | LINK_LOST_ FLAG | R | 0x0 | Back Channel Link lost Status changed. This bit is set if a change in BC LINK DET lost status has been detected. This bit is cleared upon read of CRC ERR CLR register or HS PLL loses lock. | | | |
| 3 | BIST_CRC_ERR | R | 0x0 | BIST Error is detected. The BIST_ERR_CNT register contain the number of Back Channel BIST errors. | | | |
| 2 | HS_PLL_LOCK | R | 0x1 | Forward Channel High speed PLL lock flag. | | | |
| 1 | CRC_ERR | R | 0x0 | Back Channel CRC error detected. This bit is set when the back channel errors detected when BC LINK DET is asserted. This bit is cleared upon read of CRC_ERR_CLR register. | | | |
| 0 | LINK_DET | R | 0x1 | Back Channel Link detect. This bit is set when BC link is valid. | | | |

7.7.60 GPIO Pin Status

Table 7-72. GPIO_PIN_STS For Input State Only (Address 0x53)

| BIT | FIELD | TYPE | DEFAULT | DESCRIPTION |
|-----|----------|------|---------|---|
| 7:4 | RESERVED | R | 0x0 | Reserved. |
| 3:0 | GPIO_STS | R | 0x0 | GPIO Pin Status. This register reads the current values on GPIO pins. Bit 3 reads the GPIO3 pin status. Bit 2 reads the GPIO2 pin status. Bit 1 reads the GPIO1 pin status. Bit 0 reads the GPIO0 pin status. |

7.7.61 BIST Error Count

Table 7-73. BIST_ERR_CNT (Address 0x54)

| BIT | FIELD | TYPE | DEFAULT | DESCRIPTION |
|-----|--------------------|------|---------|-------------------------------|
| 7:0 | BIST_BC_ ERRCNT | R | 0x00 | CRC error count in BIST mode. |

7.7.62 CRC Error Count 1

Table 7-74. CRC ERR CNT1 (Address 0x55)

7.7.86 Indirect Access Registers

Several functional blocks include register sets contained in the Indirect Access map (Table 7-98); that is, Pattern Generator, and Analog controls. Register access is provided through an indirect access mechanism through the Indirect Access registers (IND_ACC_CTL, IND_ACC_ADDR, and IND_ACC_DATA). These registers are located at offsets 0xB0-0xB2 in the main register space.

The indirect address mechanism involves setting the control register to select the desired block, setting the register offset address, and reading or writing the data register. In addition, an auto-increment function is provided in the control register to automatically increment the offset address following each read or write of the data register.

For writes, the process is as follows:

- 1. Write to the IND_ACC_CTL register to select the desired register block
- 2. Write to the IND ACC ADDR register to set the register offset
- 3. Write the data value to the IND ACC DATA register

If auto-increment is set in the IND_ACC_CTL register, repeating step 3 writes additional data bytes to subsequent register offset locations.

For reads, the process is as follows:

- 1. Write to the IND ACC CTL register to select the desired register block
- 2. Write to the IND_ACC_ADDR register to set the register offset
- 3. Read from the IND_ACC_DATA register

If auto-increment is set in the IND_ACC_CTL register, repeating step 3 reads additional data bytes from subsequent register offset locations.

Table 7-98. Indirect Register Map Description

| IA SELECT 0xB0[4:2] | PAGE/BLOCK | INDIRECT REGISTERS | ADDRESS RANGE | DESCRIPTION |
|------------------------|------------|-----------------------------------|------------------|---|
| 000 | 0 | Digital Page 0 Indirect Registers | 0x01 - 0x1F | Pattern Gen Registers. |
| 010 | 2 | Indirect Registers: Die ID Data | 0x00 - 0x0F | Hold 16 bytes that correspond to Die ID data. |

7.7.86.1 PGEN_CTL

8 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

8.1 Application Information

The link between the DS90UB635-Q1 and the companion deserializer has two distinct data paths. The first path is a forward channel which is nominally running at up to 4.16 Gbps and is encoded such that the channel occupies a bandwidth from 20 MHz to 2.1 GHz. The second path is a back channel from the deserializer to the serializer which occupies a frequency range nominally from 10 MHz to 50 MHz.

For these two communications links to operate properly, the circuit between the serializer and the deserializer must present a characteristic impedance of 50 Ω . Deviations from this 50- Ω characteristic will lead to signal reflections either at the serializer or deserializer, which will result in bit errors.

8.1.1 Power-over-Coax

The DS90UB635-Q1 is designed to support the Power-over-Coax (PoC) method of powering remote sensor systems. With this method, the power is delivered over the same medium (a coaxial cable) used for high-speed digital video data, bidirectional control, and diagnostics data transmission. This method uses passive networks or filters that isolate the transmission line from the loading of the DC-DC regulator circuits and their connecting power traces on both sides of the link as shown in Figure 8-1.

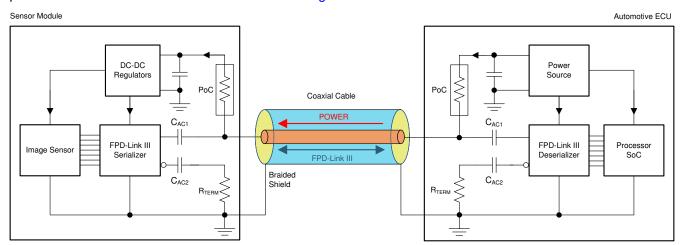

Figure 8-1. Power-over-Coax (PoC) System Diagram

The PoC networks' impedance of $\geq 1~k\Omega$ over a specific frequency band is recommended to isolate the transmission line from the loading of the regulator circuits. Higher PoC network impedance will contribute to favorable insertion loss and return loss characteristics in the high-speed channel. The lower limit of the frequency band is defined as ½ of the frequency of the back channel, f_{BC} . The upper limit of the frequency band is the frequency of the forward high-speed channel, f_{FC} . However, the main criteria that need to be met in the high-speed channel, which consists of a serializer PCB, a deserializer PCB, and a cable, are the insertion loss and return loss limits defined in the Total Channel Requirements⁽¹⁾ over the entire system, while the system is under maximum current load and extreme temperature conditions ⁽²⁾.

- Contact TI for more information on the required Channel Specifications defined for each individual FPD-Link device.
- 2. The PoC network and any components along the high-speed trace on the PCB will contribute to the PCB loss budget. TI has recommendations for the loss budget allocation for each individual PCB and cable

component in the overall high-speed channel, but the loss limits defined for the total channel in the Channel Specifications must be met.

Figure 8-2 shows an example PoC network suitable for a "4G" FPD-Link III consisting of DS90UB635-Q1 and DS90UB638-Q1 or DS90UB662-Q1 pair with the bidirectional channel operating at 50 Mbps ($\frac{1}{2}$ f_{BCC} = 25 MHz) and the forward channel operating at 4.16 Gbps (f_{FC} \approx 2.1 GHz). Other PoC networks are possible and may be different on the serializer and the deserializer boards as long as the printed-circuit board return loss requirements listed in Table 8-2 are met.

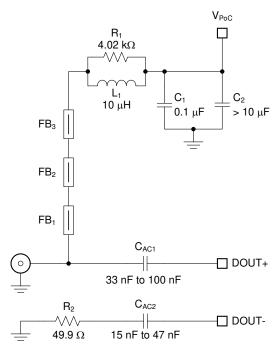

Figure 8-2. Typical PoC Network for a "4G" FPD-Link III

Table 8-1 lists essential components for this particular PoC network. Note that the impedance characteristic of the ferrite beads deviates with the bias current. Therefore, keeping the current going through the network below 150 mA is recommended.

Table 8-1. Suggested Components for a "4G" FPD-Link III PoC Network

| COUNT | REF DES | DESCRIPTION | PART NUMBER | MFR |
|-------|---------|---|------------------|--------|
| | | Inductor, 10 μ H, 0.288 Ω maximum, 530 mA minimum (Isat, Itemp) 30 MHz SRF minimum, 3 mm × 3 mm, General-Purpose | LQH3NPN100MJR | Murata |
| | | Inductor, 10 μ H, 0.288 Ω maximum, 530 mA minimum (Isat, Itemp) 30 MHz SRF minimum, 3 mm × 3 mm, AEC-Q200 | LQH3NPZ100MJR | Murata |
| 1 | L1 | Inductor, 10 μ H, 0.360 Ω maximum, 450 mA minimum (Isat, Itemp) 30 MHz SRF minimum, 3.2 mm × 2.5 mm, AEC-Q200 | NLCV32T-100K-EFD | TDK |
| | | Inductor, 10 μ H, 0.400 Ω typical, 550 mA minimum (Isat, Itemp) 39 MHz SRF typical, 3 mm × 3 mm, AEC-Q200 | TYS3010100M-10 | Laird |
| | | Inductor, 10 μ H, 0.325 Ω maximum, 725 mA minimum (Isat, Itemp) 41 MHz SRF typical, 3 mm × 3 mm, AEC-Q200 | TYS3015100M-10 | Laird |
| 3 | FB1-FB3 | Ferrite Bead, 1.5 k Ω at 1 GHz, 0.5 Ω maximum at DC 500 mA at 85°C, 0603 SMD , General-Purpose | BLM18HE152SN1 | Murata |
| | LD1-LD3 | Ferrite Bead, 1.5 k Ω at 1 GHz, 0.5 Ω maximum at DC 500 mA at 85°C, 0603 SMD , AEC-Q200 | BLM18HE152SZ1 | Murata |

In addition to the selection of PoC network components, their placement and layout play a critical role as well.

 Place the smallest component, typically a ferrite bead or a chip inductor, as close to the connector as possible. Route the high-speed trace through one of its pads to avoid stubs.

- Use the smallest component pads as allowed by manufacturer's design rules. Add anti-pads in the inner planes below the component pads to minimize impedance drop.
- Consult with the connector manufacturer for optimized connector footprint. If the connector is mounted on the same side as the IC, minimize the impact of the through-hole connector stubs by routing the high-speed signal traces on the opposite side of the connector mounting side.
- Use coupled 100- Ω differential signal traces from the device pins to the AC-coupling caps. Use 50- Ω singleended traces from the AC-coupling capacitors to the connector.
- Terminate the inverting signal traces close to the connectors with standard $49.9-\Omega$ resistors.

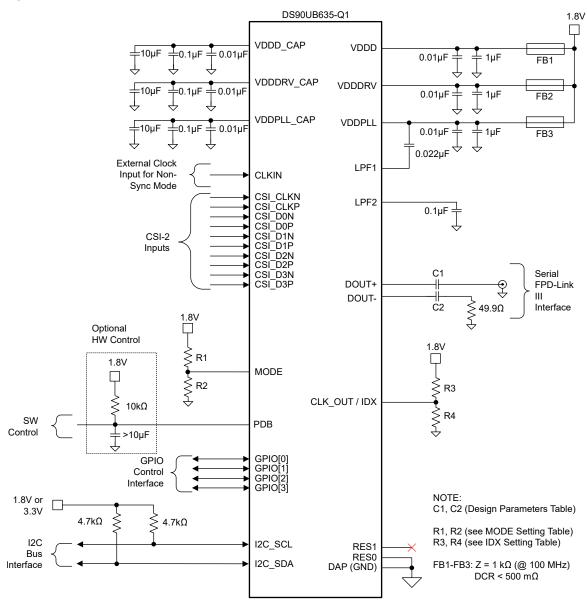

The suggested characteristics for single-ended PCB traces (microstrips or striplines) for serializer or deserializer boards are listed in Table 8-2. The effects of the PoC networks must be accounted for when testing the traces for compliance to the suggested limits.

Table 8-2. Suggested Characteristics for Single-Ended PCB Traces With Attached PoC Networks

| | PARAMETER | MIN | TYP | MAX | UNIT |
|--------------------|--|-----|-----|-----|------|
| L _{trace} | Single-ended PCB trace length from the device pin to the connector pin | | | 5 | cm |
| Z _{trace} | Single-ended PCB trace characteristic impedance | 45 | 50 | 55 | Ω |
| Z _{con} | Connector (mounted) characteristic impedance | 40 | 50 | 60 | Ω |

The V_{POC} fluctuations on the serializer side, caused by the transient current draw of the sensor, the DC resistance of cables, and PoC components, must be kept to a minimum as well. Increasing the V_{POC} voltage and adding extra decoupling capacitance (> 10 μ F) help reduce the amplitude and slew rate of the V_{POC} fluctuations.

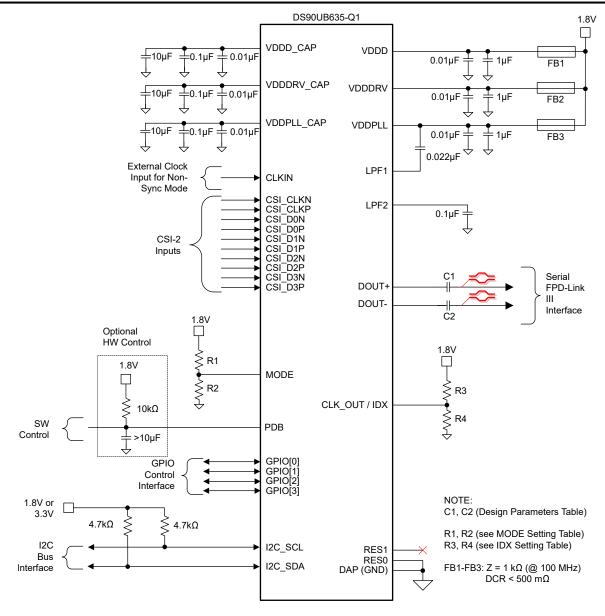

8.2 Typical Applications

Copyright © 2018, Texas Instruments Incorporated

Figure 8-3. Typical Connection Diagram Coaxial

Copyright © 2018, Texas Instruments Incorporated

Figure 8-4. Typical Connection Diagram STP

8.2.1 Design Requirements

For a typical design application, use the parameters listed in Table 8-3.

Table 8-3. Design Parameters

| DESIGN PARAMETER | PIN(S) | VALUE |
|---|-------------------------|-----------------------------------|
| V _(VDD) | VDDD, VDDDRV, VDDPLL | 1.8 V |
| AC-Coupling Capacitor for | DOUT+ | 33nF – 100 nF (50 V / X7R / 0402) |
| Synchronous Modes, Coaxial Connection | DOUT- | 15nF – 47 nF (50 V / X7R / 0402) |
| AC-Coupling Capacitor for Synchronous Modes, STP Connection | DOUT+, DOUT- | 33 – 100 nF (50 V / X7R / 0402) |
| AC-Coupling Capacitor for Non- | DOUT+ | 100 nF (50 V / X7R / 0402) |
| Synchronous and DVP Backwards Compatible Modes, Coaxial Connection | DOUT- | 47 nF (50 V / X7R / 0402) |
| AC-Coupling Capacitor for Non- Synchronous and DVP Backwards Compatible Modes, STP Connection | DOUT+, DOUT- | 100 nF (50 V / X7R / 0402) |

The SER/DES only supports AC-coupled interconnects through an integrated DC-balanced decoding scheme. External AC-coupling capacitors must be placed in series in the FPD-Link III signal path as shown in Figure 8-5 and Figure 8-6. For applications using single-ended $50-\Omega$ coaxial cable, terminate the unused data pins (DOUT+, DOUT-) with an AC-coupling capacitor and a $50-\Omega$ resistor.

Figure 8-5. AC-Coupled Connection (Coaxial)

Figure 8-6. AC-Coupled Connection (STP)

For high-speed FPD-Link III transmissions, use the smallest available package for the AC-coupling capacitor to help minimize degradation of signal quality due to package parasitics.

8.2.2 Detailed Design Procedure

Section 8.2 shows a typical application circuit of the DS90UB635-Q1. The next sections highlight recommendations for the critical device pins.

8.2.2.1 CSI-2 Interface

The CSI-2 input port on the DS90UB635-Q1 is compliant with the MIPI D-PHY v1.2 and CSI-2 v1.3 specifications. The CSI-2 interface consists of a clock and an option of one, two, or four data lanes. The clock and each of the data lanes are differential lines. The DS90UB635-Q1 CSI-2 input must be DC-coupled to a compatible CSI-2 transmitter. Follow the PCB layout guidelines given in Section 10.1.1.

8.2.2.2 FPD-Link III Input / Output

The DS90UB635-Q1 serial data out signal operates at different data rates depending upon the mode in which the device is operating. In synchronous mode, where the reference clock is provided by the deserializer, the serial data rate is up to 4.16 Gbps.

The signals at DOUT+ and DOUT- must be AC-coupled. The AC-coupling capacitor values used on DOUT+ and DOUT- depends on the mode and cable used as shown in Table 8-3. When connecting to a coax cable,

the AC-coupling capacitor on the negative terminal (DOUT-) should be approximately ½ of the AC-coupling capacitor value on DOUT+ and be terminated to a 50-Ω load. Make sure to follow the critical PCB layout guidelines given in Section 10.2.

8.2.2.3 Internal Regulator Bypassing

The DS90UB635-Q1 features three internal regulators that must be bypassed to GND. The VDDD CAP, VDDDRV CAP, and VDDPLL CAP are the pins that expose the outputs of the internal regulators for bypassing. TI recommends that each pin has a 10-μF, 0.1-μF, and a 0.01-μF capacitor to GND. The 0.01-μF caps must be placed as close as practical to the bypass pins.

8.2.2.4 Loop Filter Decoupling

The LPF1 and LPF2 pins are for connecting filter capacitors to the internal PLL circuits. LPF1 should have a 0.022-uF capacitor connected to the VDD PLL pin (pin 11). The capacitor connected between LPF1 and VDDPLL must enclose as small of a loop as possible. LPF2 must have a 0.1-µF capacitor connecting the pin to GND. One of these PLLs generates the high-speed clock used in the serialization of the output, while the other PLL is used in the CSI-2 receive port. Noise coupled into these pins degrades the performance of the PLLs in the DS90UB635-Q1, so the caps must be placed close to the pins they are connected to, and the area of the loop enclosed must be minimized.

8.2.3 Application Curve

The falling edge of the blue trace indicates that the device should shift from LP to HS mode – the rise that comes about one division later is when the DS90UB635-Q1 turns on the internal termination so the device is ready to receive HS data. The transitions are the CSI-2 data, and then the drop of the blue trace indicates that the termination has been turned off.

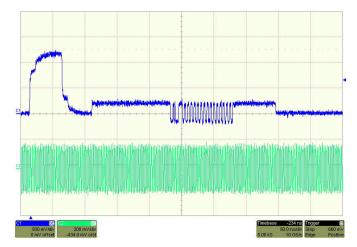

Figure 8-7. CSI-2 LP to HS Mode Transition

9 Power Supply Recommendations

This device provides separate power and ground pins for different portions of the circuit. This is done to isolate switching noise effects between different sections of the circuit. Separate planes on the PCB are typically not required. The *Pin Configuration and Functions* section provides guidance on which circuit blocks are connected to which power pin pairs. In some cases, an external filter many be used to provide clean power to sensitive circuits such as PLLs.

9.1 Power-Up Sequencing

The power-up sequence for the DS90UB635-Q1 is as follows:

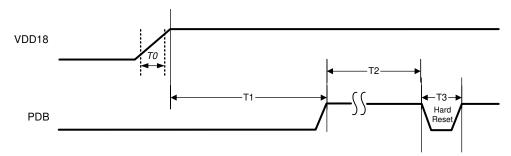

Figure 9-1. Power Supply Sequencing

Table 9-1. Timing Diagram for the Power Supply Start-Up and Initialization Sequences

| | | | - tan t - p - an t | | | |
|----|-------------------------------------|------|--------------------|-----|------|--|
| | PARAMETER | MIN | TYP | MAX | UNIT | NOTES |
| T0 | VDD18 rise time | 0.05 | | | ms | at 10/90% |
| T1 | VDD18 to PDB | 0 | | | ms | After VDD18 is stable |
| T2 | PDB high time before PDB hard reset | 1 | | | ms | |
| Т3 | PDB high to low pulse width | 3 | | | ms | Hard reset (optional) |
| T4 | PDB to I2C Ready | 2 | | | ms | See Initialization Sequence: Synchronous Clocking Mode |

9.1.1 System Initialization

When initializing the communications link between a deserializer hub and a DS90UB635-Q1 serializer, the system timing will depend on the mode selected for generating the serializer reference clock. When synchronous clocking mode is selected, the serializer will relock onto the extracted back channel reference clock when available, so there is no need for local crystal oscillator at the sensor module. The initialization sequence follows the illustration given in the Initialization Sequence: Synchronous Clocking Mode.

Submit Document Feedback

Copyright © 2023 Texas Instruments Incorporated

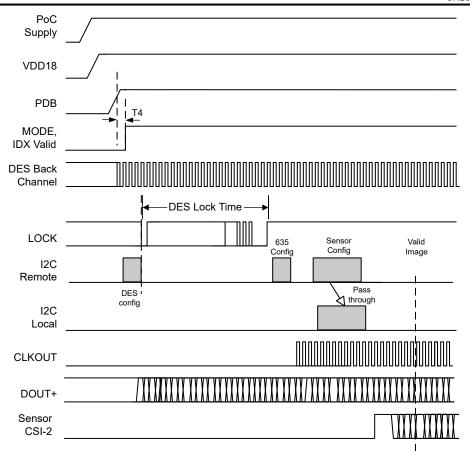

Figure 9-2. Initialization Sequence: Synchronous Clocking Mode

To allow for a quicker system bringup time, it is recommended to program the I2C watchdog timer speedup, by setting 0x0A = 0x12, before trying to access remote I2C target devices attached to the SER through the back channel from the deserializer. This will ensure a faster remote sensor access time even if the serializer I2C bus experiences unexpected noise during power up of the sensor module.

9.2 Power Down (PDB)

The Serializer has a PDB input pin to ENABLE or POWER DOWN the device. This pin may be controlled by an external device, or through VDD where VDD = 1.71 V to 1.89 V. PDB should be brought high after all power supplies on the board have stabilized.

When PDB is driven low, ensure that the pin is driven to 0 V for at least 3 ms before releasing or driving high. In the case where PDB is pulled up to VDD directly, a $10-k\Omega$ pullup resistor and a > $10-\mu$ F capacitor to ground are required.

Toggling PDB low powers down the device and resets all control registers to default. After power up, if there are any errors seen, TI recommends clearing the registers to reset the errors.

Make sure to power up the VDDDRV before or at the same time as the VDDPLL.

10 Layout

10.1 Layout Guidelines

Circuit board layout and stack-up for the FPD-Link III devices must be designed to provide low-noise power feed to the device. Good layout practice also separates high-frequency or high-level inputs and outputs to minimize unwanted stray noise pickup, feedback, and interference. External bypassing should be low-ESR ceramic capacitors with high-quality dielectric. The voltage rating of the ceramic capacitors must be at least 2× the power supply voltage being used.

TI recommends surface-mount capacitors due to their smaller parasitics. When using multiple capacitors per supply pin, place the smaller value closest to the pin. A large bulk capacitor is recommend at the point of power entry. This is typically in the 47-µF to 100-µF range, which smooths low-frequency switching noise. TI recommends connecting power and ground pins directly to the power and ground planes with bypass capacitors connected to the plane. TI also recommends that the user place a via on both ends of the capacitors. Connecting power or ground pins to an external bypass capacitor increases the inductance of the path.

A small body size X7R chip capacitor, such as 0603 or 0402, is recommended for external bypass. The small body size reduces the parasitic inductance of the capacitor. The user must pay attention to the resonance frequency of these external bypass capacitors, usually in the range of 20 to 30 MHz. To provide effective bypassing, multiple capacitors are often used to achieve low impedance between the supply rails over the frequency of interest. At high frequency, it is also common practice to use two vias from power and ground pins to the planes, reducing the impedance at high frequency.

Some devices provide separate power and ground pins for different portions of the circuit. This is done to isolate switching noise effects between different sections of the circuit. Separate planes on the PCB are typically not required. Pin description tables typically provide guidance on which circuit blocks are connected to which power pin pairs (see *Pin Configuration and Functions* for more information). In some cases, an external filter may be used to provide clean power to sensitive circuits such as PLLs.

Use at least a four-layer board with a dedicated ground plane. Place CSI-2 signals away from the single-ended or differential FPD-Link III RX input traces to prevent coupling from the CSI-2 lines to the Rx input lines. A single-ended impedance of $50~\Omega$ is typically recommended for coaxial interconnect, and a differential impedance of $100~\Omega$ is typically recommended for STP interconnect. The closely coupled lines help to ensure that coupled noise appears as common-mode and thus is rejected by the receivers. The tightly coupled lines also radiate less.

10.1.1 CSI-2 Guidelines

- Route CSI0_D*P/N pairs with controlled 100-Ω differential impedance (±20%) or 50-Ω single-ended impedance (±15%).
- 2. Keep away from other high-speed signals.
- 3. Keep the length difference between a differential pair to 5 mils of each other.
- 4. Make sure that length matching is near the location of mismatch.
- 5. Match trace lengths between the clock pair and each data pair to be < 25 mils.
- 6. Separate each pair by at least 3 times the signal trace width.
- 7. Keep the use of bends in differential traces to a minimum. When bends are used, the number of left and right bends must be as equal as possible, and the angle of the bend should be ≥ 135 degrees. This arrangement minimizes any length mismatch caused by the bends and therefore minimizes the impact that bends have on EMI.
- 8. Route all differential pairs on the same layer to help match trace impedance characteristics.
- 9. Keep the number of VIAS to a minimum—TI recommends keeping the VIA count to two or fewer.
- 10. Keep traces on layers adjacent to ground plane.
- 11. Do NOT route differential pairs over any plane split.

Note

Adding test points can cause impedance discontinuity and therefore negatively impacts signal performance. If test points are used, place them in series and symmetrically. Test points must not be placed in a manner that causes a stub on the differential pair.

10.2 Layout Examples

Figures below Figure 10-1, Figure 10-2, and Figure 10-3 are examples are taken from the layout of an FPD-Link EVM board. All EVM layers are included in *DS90UB953-Q1EVM user's guide* (SNLU224). Note that the DS90UB953-Q1 shares this user guide with other related products such as the DS90UB635-Q1.

Routing the FPD-Link III signal traces between the DOUT pins and the connector, as well as connecting the PoC filter to these traces, are the most critical pieces of a successful DS90UB635-Q1 PCB layout. The following list provides essential recommendations for routing the FPD-Link III signal traces between the driver output pins and the FAKRA connector, as well as connecting the PoC filter.

- The routing of the FPD-Link III traces may be all on the top layer or partially embedded in middle layers if EMI is a concern.
- The AC-coupling capacitors should be on the top layer and very close to the receiver input pins to minimize the length of coupled differential trace pair between the pins and the capacitors.
- Route the DOUT+ trace between the AC-coupling capacitor and the FAKRA connector as a 50-Ω single-ended micro-strip with tight impedance control (±10%). Calculate the proper width of the trace for a 50-Ω impedance based on the PCB stack-up. Ensure that the trace can carry the PoC current for the maximum load presented by the remote sensor module.
- The PoC filter should be connected to the DOUT+ trace through the ferrite bead or an RF inductor. The ferrite bead should be touching the high-speed trace to minimize the stub length seen by the transmission line. Create an anti-pad or a moat under the ferrite bead pad that touches the trace. The anti-pad should be a plane cutout of the ground plane directly underneath the top layer without cutting out the ground reference under the trace. The purpose of the anti-pad is to maintain the impedance as close to 50 Ω as possible.
- When routing DOUT+ on inner layers, length matching for single-ended traces does not provide a significant benefit. If the user wants to route the DOUT+ on the top or bottom layer, route the DOUT- trace loosely coupled to the DOUT+ trace for the length similar to the DOUT+ trace length. This may help the differential nature of the receiver to cancel out any common-mode noise that may be present in the environment that may couple on to the signal traces.

11.2 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

11.3 Support Resources

TI E2E[™] support forums are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

11.4 Trademarks

TI E2E™ is a trademark of Texas Instruments.

All trademarks are the property of their respective owners.

11.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

⁽¹⁾ Status: For more details on status, see our product life cycle.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

⁽²⁾ Material type: When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ RoHS values: Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

⁽⁴⁾ Lead finish/Ball material: Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ MSL rating/Peak reflow: The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ Part marking: There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.
