

DS90UB936-Q1 SNLS571C - MARCH 2018 - REVISED JANUARY 2023

# DS90UB936-Q1 Dual 3 Gbps FPD-Link III Deserializer Hub With MIPI CSI-2 Outputs

### 1 Features

- AEC-Q100 qualified for automotive applications:
  - Device temperature grade 2: –40°C to +105°C ambient operating temperature range
- 2.528 Gbps CSI-2 video bandwidth per channel
- MIPI DPHY Version 1.2 / CSI-2 Version 1.3 compliant
  - CSI-2 output ports
  - Supports 1, 2, 4 data lanes
  - CSI-2 data rate scalable for 400 Mbps / 800 Mbps / 1.5 Gbps / 1.6 Gbps each data lane
  - Programmable data types
  - Four virtual channels
  - ECC and CRC generation
- 2x2 Output replication mode
- Ultra-low data and control path latency
- Supports single-ended coaxial or Shielded Twisted-Pair (STP) cable
- · Adaptive receive equalization
- I2C with fast-mode plus up to 1 Mbps
- Flexible GPIOs for camera diagnostics
- Compatible with DS90UB935-Q1, DS90UB953-Q1, DS90UB933-Q1 and DS90UB913A-Q1 serializers
- Line fault detection and advanced diagnostics
- ISO 10605 and IEC 61000-4-2 ESD compliant

# 2 Applications

- Automotive ADAS
  - Rear View Cameras (RVC)
  - Surround View Systems (SVS)
  - Camera Monitor Systems (CMS)
  - Forward Vision Cameras (FC)
  - Driver Monitoring Systems (DMS)
  - Satellite RADAR, Time of Flight (ToF) and LIDAR Sensor Modules
- Security and Surveillance
- **Industrial and Medical Imaging**

### 3 Description

The DS90UB936-Q1 is a versatile deserializer capable of receiving serialized sensor data from source through an FPD-Link III interface. When paired with a DS90UB935-Q1 serializer, the DS90UB936-Q1 receives data from imagers supporting up to 2.528 Gbps CSI-2 throughput. The DS90UB936-Q1 may also be used with other compatible serializers such as the DS90UB933-Q1, and DS90UB913A-Q1. When configuring the CSI-2 interface for 2-lane operation, a duplicate MIPI CSI-2 clock lane is available to provide a replicated output. Replication mode creates two copies of the video stream for data logging and parallel processing.

The DS90UB935/936-Q1 chipset is AEC-Q100 qualified and designed to receive data across either 50-Ω single-ended coaxial or 100-Ω differential STP cables. AEC-Q100 qualification includes device temperature grade 2 (-40°C to +105°C ambient operating temperature range), device HBM ESD classification level ±4.5 kV, and device CDM ESD classification level C5. The deserializer hub is ideal for Power-over-Coax applications and the receive equalizer automatically adapts to compensate for cable loss characteristics with no additional programming required, including cable degradation over time.

Each FPD-Link III interface includes a separate low latency bidirectional control channel (BCC) that continuously conveys I2C, GPIO, and other control information. GPIO signals purposed for sensor synchronization and diagnostic features also make use of the BCC.

#### **Device Information**

PART NUMBER	PACKAGE (1)	BODY SIZE (NOM)
DS90UB936-Q1	VQFN (48)	7.00 mm × 7.00 mm

For all available packages, see the orderable addendum at the end of the data sheet.

Typical Application Schematic

**4 Revision History**NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

C	nanges from Revision B (June 2016) to Revision C (January 2023)	raye
•	Updated the numbering format for tables, figures, and cross-references throughout the document	1
•	Changed all instances of legacy terminology to controller and target	
•	Updated the list of compatible devices to include the DS90UB953-Q1	1
•	Revised the PDB pin voltage for normal operation	4
•	Changed the VDD11 pin descriptions for clarity	
•	Added a link to Design Requirements under the RIN pins	4
•	Updated the V <sub>IH</sub> and V <sub>II</sub> specifications of pins PDB, XIN/REFCLK, and VDD_SEL	10
•	Removed the mention of CSI-2 non-synchronous clocking mode	26
•	Changed the bits that need to be modified for Clock Mode	<mark>27</mark>
•	Removed the mention of setting the REF_CLK_MODE bit as it is a reserved bit	42
•	Fixed typos in the internal FrameSync calculations	
•	Rewrote the basic synchronized forwarding code example to set both sensors to use CSI-2 serializers	s4 <mark>8</mark>
•	Added in that V <sub>VDDIO</sub> must match V <sub>I2C</sub>	54
•	Removed the mention of 'PDB' from register 0x0D	<mark>75</mark>
•	Changed BCC_Config Register[2:0] binary setting value 0b111 to reserved	99
•	Changed PORT_CONFIG2[5] default value to 0x1	
•	Changed suggested ferrite beads for 4G FPD-Link PoC Network from 1500 kΩ to 1.5 kΩ	139
•	Changed PoC network impedance recommendation from $2k\Omega$ to $1k\Omega$	139
•	Updated the PoC description	
•	Removed the insertion and return loss values from the table on Suggested Characteristics for Single-	Ended
	PCB Traces With Attached PoC Networks	
•	Added a note to explain the differences between the decoupling capacitors	
•	Changed the value of the capacitor for pin VDD11_CSI from 1-μF to 10-μF in the diagram where VDE	)_SEL =
	HIGH	143
•	Moved the additional notes in the typical application diagram from the picture to below the diagram	143
•	Added a note to clarify the power-up sequence between VDD18 and VDDIO	148

#### www.ti.com

•	Removed T0 and T2 from power-up sequence	148
•	Added a note to clarify that a hard reset is optional in the power-up sequence	
•	Added in T7, the PDB to I2C ready delay, to the power-up sequence	
•	Changed the pull-up resistor for PDB from 33-k $\Omega$ to 10-k $\Omega$ .	149
_	hanges from Revision A (April 2018) to Revision B (June 2018)	Page
_	Added discrete synch signals requirement when using DVP format	
•	Changed FPD3_PCLK to f <sub>PCLK</sub> in the RAW mode line rate calculations	
	Added information about YUV support	
	Relaxed REFCLK Oscillator jitter specification to 200 ps maximum	
•	Relaxed REFCLK Oscillator rise and fall time to 6 ns maximum	
	Added REFCLK spread-spectrum modulation percentage and frequency	
	Updated Forward Channel GPIO typical latency value	
•	Updated Back Channel GPIO typical latency and jitter for 50 Mbps rate	
•	Added need for discrete synch signals in DVP mode and included RAW/YUV support	
•	Changed from GPIO7 pin to GPIO6 pin	
•	Deleted sentence "It is recommended to forward the relevant RX port data streams prior to enabling	
•	CSI-2 TX output"	
•	Added Enabling and Disabling the CSI-2 Transmitter section	47
•	Added sentence about RX port specific register for registers 0x4A, 0x4B, 0x4D - 0x7F, 0xD0 - 0xDF	92
•	Updated RX_PORT_STS2 register bit 1 field and description	95
•	Changed PAR_ERROR line _BYTE_1 to PAR_ERROR _BYTE_1 and RX PARITY CHECKER ENABLE.	
	RX_PARITY_CHECKER_ENABLE	
•	Redraw the PoC Network diagram	
•	Updated Return Loss S11 values	
<u>.</u>	Redraw RINx STP setting for figure "Typical Connection Diagram STP With External 1.1-V supply"	143 
С	hanges from Revision * (March 2018) to Revision A (April 2018)	Page
•	Deleted the duplicate I <sub>DD2-R1T4</sub> parameters from the <i>DC Electrical Characteristics</i> table	
•	Deleted the duplicate I <sub>DD2-R2T22</sub> parameter from the <i>DC Electrical Characteristics</i> table	
•	Deleted the duplicate I <sub>DD2-R1T22</sub> parameter from the <i>DC Electrical Characteristics</i> table	
•	Deleted the strap input current spec.	
•	Changed the output short circuit current symbol from I <sub>SC</sub> to I <sub>OS</sub>	10
•	Added 12-bit LF mode description and added 12-bit HF notation in the Strap Configuration Mode Sel	
•	Changed BCC_Config Register 0x58[2:0] binary setting value from 0b100 to 0b010 to select 10 Mbp	
	synchronous back channel rate	99

Table 5-1. Pin Functions (continued)					
	I/O TYPE	DESCRIPTION			
NO.	ITE				
4	0	Crystal oscillator output: Output Pin for providing crystal oscillator reference. Leave this pin NC when reference clock input is driving XIN/REFCLK.			
5	S, I	Reference clock input or crystal oscillator input. Pin is shared with XIN and REFCLK. Typically REFCLK connected to 23- to 26-MHz reference oscillator output (100 ppm) or XIN configured with external 23- to 26-MHz crystal to XOUT. See Section 7.4.4.			
D GPIO					
28					
27		General-Purpose Input/Output: Pins can be used to control and respond to various			
26		commands. They may be configured to be the input signals for the corresponding GPIOs on the serializer or they may be configured to be outputs to follow local			
10	I/O, PD	register settings. At power up, the GPIO are disabled and by default include a 35-k			
9		(typical) pulldown resistor. See Section 7.4.13 for programmability. Unused GPIO			
		can be left open or no connect.			
25	I/O, OD	General-Purpose Input/Output: Pin GPIO3 can be configured to be input signals for GPOs on the Serializer. Pin 25 is shared with INTB. Pullup with 4.7 k $\Omega$ to V <sub>(VDDIO)</sub> . The programmable input and output pin is an active-low open drain and controlled by the status registers. See Section 7.4.13 for programmability. Unused GPIO can be left open or no connect.			
	•				
41		Receive Input Channel 0: Differential FPD-Link receiver and bidirectional control			
42	I/O	back channel output. The IO must be AC coupled. See <i>Design Requirements</i> for the correct AC-coupling capacitor values. If port is unused, leave NC and set RX_PORT_CTL register bit 0 = 0 to disable (see <i>Section 7.4.6</i> ).			
32		Receive Input Channel 1: Differential FPD-Link receiver and bidirectional control			
33	I/O	back channel output. The IO must be AC coupled. See <i>Design Requirements</i> for the correct AC-coupling capacitor values. If port is unused, leave NC and set RX_PORT_CTL register bit 1 = 0 to disable (see <i>Section 7.4.6</i> ).			
2	I/O, OD	I2C Serial Clock: Clock line for the bidirectional control bus communication. External 2-k $\Omega$ to 4.7-k $\Omega$ pullup resistor to 1.8-V or 3.3-V supply rail recommended per I2C interface standards. I2C_SCL and I2C_SDA inputs are 3.3-V tolerant. See Section 7.5.1 for more information.			
1	I/O, OD	I2C Serial Data: Data line for bidirectional control bus communication. External 2-k $\Omega$ to 4.7-k $\Omega$ pullup resistor to 1.8-V or 3.3-V supply rail recommended per I2C interface standards. I2C_SCL and I2C_SDA inputs are 3.3-V tolerant. See Section 7.5.1 for more information.			
ONTROL PIN	is				
46	S, PD	VDD Select: Configuration pin to select internal LDO regulator supply. When VDD_SEL = LOW, internal 1.1-V supply mode is selected. Feed 1.8 V to VDD18 inputs = 1.8 V ±5%. An internal 1.1-V regulator will supply the VDD11. VDD11 inputs should be terminated with bypass capacitors. When VDD_SEL = HIGH, external 1.1-V supply mode is selected. After 1.8-V supply is applied to VDD18 inputs, then apply 1.1 V to VDD11 inputs = 1.1 V ±5%. Voltage at VDD11 supply pins must always be less than main voltage applied to VDD18 when using external 1.1-V supply.			
35	S, PD	Input. I2C Serial Control Bus Primary Device ID Address Select.  Once enabled the voltage at this pin will be sampled to configure the default I2C device address. Typically connected with external pullup resistor to VDD18 and pulldown resistor to GND to create a voltage divider. See <i>Table 7-15</i> .			
37	S, PD	Mode select configuration input to set operating mode based on input voltage level. Typically connected to voltage divider through external pullup to VDD18 and pulldown to GND. See Table 7-2.			
	4 5 D GPIO 28 27 26 10 9 8 25  41 42 32 33  2 1 CONTROL PIN 46	NO.   I/O   TYPE			

# **Table 5-1. Pin Functions (continued)**

PIN		I/O Continued)	
NAME	NO.	TYPE	DESCRIPTION
PDB	30	I, PD	Power-down inverted Input Pin. Typically connected to processor GPIO with pull down. When PDB input is brought HIGH, the device is enabled and internal register and state machines are reset to default values. Asserting PDB signal low will power down the device and consume minimum power with CSI-2 Tx outputs in tri-state. The default function of this pin is PDB = LOW; POWER DOWN with internal 50 k $\Omega$ pull down enabled. PDB should remain low until after power supplies are applied and reach minimum required levels. <b>PDB INPUT IS 3.3-V TOLERANT</b> . See section Section 9.2. PDB = 1.8 V, device is enabled (normal operation) PDB = 0, device is powered down.
DIAGNOSTIC PINS			
CMLOUTP	38	0	Monitor Loop-Through Driver differential output. Typically routed to test points
CMLOUTN	39		and not connected. For monitoring, CMLOUT should be terminated with $100-\Omega$ differential load. See <i>Section 7.4.10</i> .
BISTEN	6	S, PD	BIST Enable: BISTEN = H, BIST Mode is enabled BISTEN = L, BIST Mode is disabled. If unused connect BISTEN directly to GND. See BIST section <i>Section</i> 7.5.12 for more information.
PASS	47	0	PASS Output: PASS = H indicates pass conditions are met and PASS = L signals or more pass condition is not met. Typically route to processor input pin or test point for monitoring. May also be configured to indicate logical AND of pass status when both Rx ports are enabled. See Section 7.4.7 for more information. For BIST operation PASS = H, ERROR FREE Transmission in forward channel operation. PASS = L, one or more errors were detected in the received payload. See BIST section for more information. Leave No Connect if unused.
LOCK	48	0	LOCK Status: Output Pin for monitoring lock status of FPD-Link III channel, may be used as Link Status. LOCK = H, the FPD-Link III receiver is Locked and Rx Ports are active. LOCK = L, receiver is unlocked. May also be configured to indicate logical AND of lock status when both Rx ports are enabled. See Section 7.4.7 for more information. Leave No Connect if unused.
RES	44	PD	RES must be tied to GND for normal operation.
POWER AND GROUND			
VDDIO	7,29	Р	VDDIO voltage supply input: The single-ended outputs and control input are powered from VDDIO. VDDIO can be connected to either a 1.8-V or 3.3-V supply rail. When VDDIO is connected to 1.8-V supply, VDDIO must be within ±100 mV of VDD18 to ensure output timing requirements are met. Each VDDIO pin requires a minimum 1-µF and 0.01-µF capacitor to GND.
VDD18_CSI	17	Р	1.8-V (±5%) Power Supply. Requires 1-μF and 0.01-μF capacitors to GND.
VDD18_P0 VDD18_P1	45 36	Р	1.8-V(±5%) Power Supplies. Requires 0.01-μF capacitors to GND at each VDD pin along with 10-μF bulk decoupling
VDD18_FPD0 VDD18_FPD1	40 31	Р	1.8-V(±5%) Analog Power Supplies. Requires 10-μF, and 0.1-μF capacitors to GND at each VDD pin.
VDD11_FPD0	43	D, P	When VDD_SEL = LOW: <b>Do not connect to 1.1-V power rail</b> Requires 0.1 to 0.01-μF capacitor and a 4.7-μF capacitor to GND  When VDD_SEL = HIGH: <b>Connect to external 1.1-V power rail</b> Requires a 0.01-μF capacitor to GND  Requires a 10-μF capacitor to GND shared with VDD11_FPD1  See sections <i>Power Supply Recommendations</i> and <i>Typical Application</i> for more information

**Table 5-1. Pin Functions (continued)** 

PIN		I/O	DESCRIPTION	
NAME	NO.	TYPE	DESCRIPTION	
VDD11_FPD1	34	D, P	When VDD_SEL = LOW: <b>Do not connect to 1.1-V power rail</b> Requires a 0.1 to 0.01-μF capacitor and a 4.7-μF capacitor to GND  When VDD_SEL = HIGH: <b>Connect to external 1.1-V power rail</b> Requires a 0.01-μF capacitor to GND  Requires a 10-μF capacitor to GND shared with VDD11_FPD0	
VDD11_CSI	20	D, P	When VDD_SEL = LOW: <b>Do not connect to 1.1-V power rail</b> Requires a 0.1 to 0.01-μF capacitor and a 4.7-μF capacitor to GND When VDD_SEL = HIGH: <b>Connect to external 1.1-V power rail</b> Requires a 0.01-μF capacitor and a 10-μF capacitor to GND	
VDD11_D	3	D, P	When VDD_SEL = LOW: <b>Do not connect to 1.1-V power rail</b> Requires a 0.1 to 0.01-μF capacitor and a 4.7-μF capacitor to GND  When VDD_SEL = HIGH: <b>Connect to external 1.1-V power rail</b> Requires a 0.01-μF capacitor and a 1-μF capacitor to GND	
GND	DAP	G	DAP is the large metal contact at the bottom side, located at the center of the QFN package. Connect to the ground plane (GND).	

The definitions below define the functionality of the I/O cells for each pin. TYPE:

- I = Input
- O = Output
- I/O = Input/Output
- S = Configuration pin (All strap pins have internal pulldowns. If the default strap value is needed to be changed then use an external resistor.)
- PD = Internal pulldown
- OD = Open Drain
- P, G = Power supply, ground
- D = Decoupling pin for internal voltage rail

# 7 Detailed Description

#### 7.1 Overview

The DS90UB936-Q1 is a versatile descrializer that aggregates up to two inputs acquired from a FPD-Link III stream and transmits the received data over a MIPI camera serial interface (CSI-2). When coupled with an ADAS FPD-Link III serializer ( DS90UB935-Q1, DS90UB933-Q1 or DS90UB913A-Q1), the DS90UB936-Q1 receives data streams from multiple sensors to be multiplexed on the same CSI-2 links.

Table 7-1. Serializer Compatibility

Serializer	DS90UB935-Q1	DS90UB953-Q1	DS90UB933-Q1	DS90UB913A-Q1	
Compatibility	Yes	No	Yes	Yes	

#### 7.1.1 Functional Description

The DS90UB936-Q1 FPD-Link III Deserializer, in conjunction with an ADAS FPD-Link III serializer supports the video transport needs with an ultra-high speed forward channel and an embedded bidirectional control channel. The DS90UB936-Q1 received data is output from a configurable MIPI CSI-2 port. The CSI-2 port may be configured as either a single CSI-2 output with four lanes up to 1.662 Gbps per lane or as two 2 lane CSI-2 outputs for sending replicated data on both ports. A second differential clock is available for the second replicated output when configured for dual CSI-2 outputs supporting one clock lane and one or two data lanes each. The DS90UB936-Q1 can support multiple data formats and different resolutions as provided by the sensor. Conversion between different data formats is not supported. The CSI-2 Tx module accommodates both image data and non-image data (including synchronization or embedded data packets).

The DS90UB936-Q1 CSI-2 interface combines each of the sensor data streams into packets designated for each virtual channel. The output generated is composed of virtual channels to separate different streams to be interleaved. Each virtual channel is identified by a unique channel identification number in the packet header.

When the DS90UB936-Q1 is paired with a DS90UB935-Q1 serializer, the received FPD-Link III forward channel is constructed in 40-bit long frames. Each encoded frame contains video payload data, I2C forward channel data, and additional information on framing, data integrity and link diagnostics. The high-speed, serial bit stream from the DS90UB935-Q1 contains an embedded clock and DC-balancing ensuring sufficient data line transitions for enhanced signal quality. When paired with ADAS serializers in RAW input mode, the received FPD-Link III forward channel is similarly constructed at a lower line rate in 28-bit long frames. The DS90UB936-Q1 device recovers a high-speed, FPD-Link III forward channel signal and generates a bidirectional control channel control signal in the reverse channel direction. The DS90UB936-Q1 converts the FPD-Link III stream into a MIPI CSI-2 output interface designed to support automotive sensors, including image sensors supplying up to 2.5-Gbps CSI-2 data.

The DS90UB936-Q1 device has two receive input ports to accept up to two sensor streams simultaneously. The control channel function of the DS90UB93x-Q1 chipset provides bidirectional communication between the image sensors and ECU. The integrated bidirectional control channel transfers data bidirectionally over the same differential pair used for video data interface. This interface offers advantages over other chipsets by eliminating the need for additional wires for programming and control. The bidirectional control channel bus is controlled through an I2C port. The bidirectional control channel offers continuous low latency communication and is not dependent on video blanking intervals. The DS90UB935-Q1/936-Q1 chipset can operate entirely off of the back channel frequency clock generated by the DS90UB936-Q1 and recovered by the DS90UB935-Q1. The DS90UB935-Q1 provides the reference clock source for the sensor based on the recovered back channel clock. Synchronous clocking mode provides distinct advantages in a multi-sensor system by locking all of the sensors and the receiver to a common reference in the same clock domain, which reduces or eliminates the need for data buffering and re-synchronization. This mode also eliminates the cost, space, and potential failure point of a reference oscillator within the sensor. The DS90UB93x-Q1 chipset offer customers the choice to work with different clocking schemes. The DS90UB93x-Q1 chipset can also use an external oscillator as the reference clock source for the PLL as the primary reference clock to the serializer (see the DS90UB935-Q1 data sheet).

#### 7.2 Functional Block Diagram

Figure 7-1. Functional Block Diagram

#### 7.3 Feature Description

The DS90UB936-Q1 provides a flexible deserializer for automotive sensor applications. The device includes two FPD-Link III inputs for sensor data streams from one or two DS90UB935-Q1 serializers. The FPD-Link III interface is also compatible with DS90UB933-Q1 and DS90UB913A-Q1 ADAS serializers. Data received from the two input ports is aggregated onto a CSI-2 TX output with up to 4 data lanes.

#### 7.4 Device Functional Modes

The DS90UB936-Q1 operating modes:

- CSI-2 Mode (DS90UB935-Q1 compatible)
- RAW Mode (DS90UB913A-Q1 and DS90UB933-Q1 compatible)

The two modes control the FPD-Link III receiver operation of the device. In cases, the output format for the device is CSI-2 through the CSI-2 transmit port.

Each input port can be individually configured for CSI-2 or RAW modes of operation.

The input mode of operation is controlled by the FPD3\_MODE (Register 0x6D[1:0]) setting in the Port Configuration register. The input mode may also be controlled by the MODE strap pin.

#### 7.4.1 CSI-2 Mode

When operating in CSI-2 FPD-Link III input mode (with DS90UB935-Q1), the DS90UB936-Q1 receives CSI-2 formatted data on one or two FPD-Link III input ports and forwards the data to the CSI-2 transmit port. The deserializer can operate in CSI-2 mode with synchronous back channel reference or non-synchronous mode. The forward channel line rate is independent of the CSI-2 rate in synchronous or non-synchronous with external clock mode, with the DS90UB936-Q1 supporting up to 2.5 Gbps CSI-2 throughput per link. Each CSI-2 mode supports remapping of Virtual Channel IDs at the input of each receive port. This allows handling of conflicting VC-IDs for input streams from dual sensors and sending those streams to the same CSI-2 transmit port.

In CSI-2 mode each deserializer Rx Port can support an FPD-Link line rate up to 4.16 Gbps, where the forward channel and back channel rates are based on the reference frequency used for the serializer:

www.ti.com

- In Synchronous mode based on REFCLK input frequency reference, the FPD-Link line rate is a fixed value of 160 × REFCLK. FPD3 PCLK = 4 × REFCLK and Back channel rate = 2 × REFCLK. For example with REFCLK = 25 MHz, line rate = 4.0 Gbps, FPD3 PCLK = 100 MHz, back channel data rate = 50 Mbps.
- In Non-synchronous clocking mode when the DS90UB935-Q1 uses external reference clock (f<sub>CLKIN</sub>) the FPD-Link line rate is typically f<sub>CLKIN</sub> × 80, FPD3\_PCLK = 2 × f<sub>CLKIN</sub> or 1 x f<sub>CLKIN</sub> and back channel data rate is set to 10 Mbps. For example, with f<sub>CLKIN</sub> = 50 MHz, line rate = 4Gbps, FPD3\_PCLK = 100 MHz, and the back channel rate is 10 Mbps. The sensor CSI-2 rate is independent of the f<sub>CLKIN</sub>.

#### **7.4.2 RAW Mode**

When operating in Raw FPD-Link III input mode, the DS90UB936-Q1 receives RAW10 or RAW12 data from a DS90UB913A-Q1 or DS90UB933-Q1 serializer. The data is translated into a RAW10 or RAW12 CSI-2 video stream for forwarding to the CSI-2 transmit port. For each input port, the CSI-2 packet header VC-ID and Data Type are programmable.

DVP RAW8 data format is also supported in serializer RAW10 transmit mode with 8/10 data input bits (MSB or LSB) connected to the serializer DVP source. DVP format serializer inputs must have discrete synch signals. When paired with DS90UB9x3x-Q1 serializers, the DS90UB936-Q1 utilizes the HSYNC and VSYNC inputs to construct the MIPI CSI-2 Tx data packets. Ensure the Frame Valid to Line Valid setup time is configured appropriately for DVP input system use cases as a minimum setup timing is required as per Table 7-11.

In RAW mode the DS90UB936-Q1 deserializer each Rx Port can support up to:

- 12 bits of DATA + 2 SYNC bits for an input PCLK range of 37.5 MHz to 100 MHz (75 MHz for 913A-Q1) in the 12-bit, high frequency mode. Line rate =  $f_{PCLK} \times (2/3) \times 28$ ; for example,  $f_{PCLK} = 100$  MHz, line rate = (100 MHz)  $\times$  (2/3)  $\times$  28 = 1.87 Gbps. Note: No HS/VS restrictions (raw).
- 10 bits of DATA + 2 SYNC bits for an input PCLK range of 50 MHz to 100 MHz in the 10-bit mode. Line rate =  $f_{PCLK}/2 \times 28$ ; for example,  $f_{PCLK} = 100$  MHz, line rate =  $(100 \text{ MHz/2}) \times 28 = 1.40$  Gbps. Note: HS/VS is restricted to no more than one transition per 10 PCLK cycles.
- 12 bits of DATA + 2 bits SYNC for an input PCLK range of 25 MHz to 50 MHz in the 12-bit low frequency mode. Note: No HS/VS restrictions (raw).

When operating with DVP serializer, the DS90UB936-Q1 deserializer also supports DVP formats such as YUV-422 which have the same pixel packing as RAW8, RAW10 or RAW12. For example; there are 3 YUV CSI-2 data types that have the same pixel packing as RAW10: YUV420 10 bit, YUV420 10 bit Chroma shifted or YUV422 10bit. These formats can be used as well as 8 bit and 12 bit YUV formats which adhere to the same structure as RAW8 and RAW12 respectively.

#### 7.4.3 RX MODE Pin

Configuration of the FPD-Link III operating input mode may be done through the MODE input strap pin, or through the configuration register bits. A pullup resistor and a pull-down resistor of suggested values may be used to set the voltage ratio of the MODE input (V<sub>TARGET</sub>) and V<sub>(VDD18)</sub> to select one of the 8 possible selected modes. The DS90UB936-Q1 waits 1 ms after PDB goes high to allow time for power supply transients before sampling the MODE pin strap value and configuring the device to set the I2C address. Possible configurations are:

- CSI-2 input Rx REFCLK mode
- RAW12 / RAW10 DVP Rx modes

Figure 7-2. Strap Pin Connection Diagram

Table 7-2. Strap Configuration Mode Select

MODE NO.	V <sub>TARGET</sub> VOLTAGE RANGE			V <sub>TARGET</sub> STRAP VOLTAGE	SUGGESTED STRA	RX MODE

The strapped values can be viewed and modified in the following locations:

- RX Mode Port Configuration FPD3\_MODE (Register 0x6D[1:0])
- Clock Mode Device Status and CSI\_PLL\_CTL (Register bits 0x04[4] and 0x1F[1:0])

#### **7.4.4 REFCLK**

A valid 23-MHz to 26-MHz reference clock is required on the REFCLK pin 5 for precise frequency operation. The REFCLK frequency defines all internal clock timers, including the back channel rate, I2C timers, CSI-2 datarate, FrameSync signal parameters, and other timing critical internal circuitry. REFCLK input must be continuous. If the REFCLK input does not detect a transition more than 20  $\mu$ S, this may cause a disruption in the CSI-2 output. REFCLK should be applied to the DS90UB936-Q1 only when the supply rails are above minimum levels (see Section 9.2). At start-up, the DS90UB936-Q1 defaults to an internal oscillator to generate an backup internal reference clock at nominal frequency of 25 MHz  $\pm$ 10%.

The REFCLK LVCMOS input oscillator specifications are listed in Table 7-3.

Table 7-3. REFCLK Oscillator Specifications

tubio / Office Opinion opcomications								
PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT

Spread-spectrum clock modulation percentage	Down Spread	-1		0	%			
Spread-spectrum clock modulation frequency				33	KHz			

#### 7.4.5 Crystal Recommendations

A 25-MHz, parallel, 18-pF load crystal resonator should be used if a crystal source is desired. Figure 7-3 shows a typical connection for a crystal resonator circuit. The load capacitor values will vary with the crystal vendors; check with the vendor for the recommended loads.

Figure 7-3. Crystal Oscillator Circuit

As a starting point for evaluating an oscillator circuit, if the requirements for the crystal are not known, CL1 and CL2 should be set at 27 pF and R1 should be set at 0  $\Omega$ . Specification for 25-MHz crystal are listed in Table 7-4.

Table 1-4. 20 Mil 2 of yotal opecifications								
PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT			
REFERENCE CLOCK								
Frequency			25		MHz			
Frequency Tolerance and Stability	Across operational temperature and aging			±100	ppm			

Table 7-4. 25 MHz Crystal Specifications

#### 7.4.6 Receiver Port Control

The DS90UB936-Q1 can support single or dual simultaneous inputs to Rx port 0 and Rx port 1. The Receiver port control register RX\_PORT\_CTL 0x0C (Table 7-31) allows for disabling one or both of the Rx inputs when not in use. These bits can only be written by a local I2C controller at the deserializer side of the FPD-Link.

Each FPD-Link III Receive port has a unique set of registers that provides control and status corresponding to Rx port 0 or Rx port 1. Control of the FPD-Link III port registers is assigned by the FPD3\_PORT\_SEL register, which sets the page controls for reading or writing individual ports unique registers. For each of the FPD-Link III Receive Ports, the FPD3\_PORT\_SEL 0x4C register defaults to selecting that port's registers as detailed in register description (Table 7-86).

As an alternative to paging to access FPD-Link III Receive unique port registers, separate I2C addresses may be enabled to allow direct access to the port-specific registers. The Port I2C address registers allow programming a separate 7-bit I2C address to allow access to unique, port-specific registers without paging. I2C commands to these assigned I2C addresses are also allowed access to all shared registers (see Table 7-179).

#### 7.4.6.1 Video Stream Forwarding

Video stream forwarding is handled by the Rx Port forwarding control in register 0x20 (see *Section 7.6.33*). Forwarding from input ports are disabled by default and must be enabled using per-port controls. Different options for forwarding CSI-2 packets can also be selected as described starting in *Section 7.4.28*.

#### 7.4.7 LOCK and PASS Status

The DS90UB936-Q1 provides dedicated PASS and LOCK outputs for monitoring status as well as through the DEVICE\_STS register (address 0x04). The source of the deserializer LOCK and PASS signals for pin monitoring and interrupt operation is also controlled by the LOCK\_SEL and PASS\_SEL fields in the RX\_PORT\_CTL register. The source of the LOCK and PASS can be allocated to either of the following system use cases: 00: Port 0 Receiver, 01: Port 1 Receiver, 10: Any Enabled Receiver Port (Logical OR), and 11: All Enabled Receiver Ports (logical AND). At start-up, the deserializer will synchronize with the input signal provided by the serializer and assert the LOCK indication once stable. The lock detect circuit includes an option to check for link bit errors as part of the lock detection and determine if LOCK is lost. The Receive Port Lock status is available for each port through the RX\_PORT\_STS1 register 0x4D. The LOCK status may also be used to enable video forwarding and other options. I2C communication across the FPD-Link should be attempted only during LOCK condition.

In RAW12 mode, the LOCK pin is only high if there is a link with a serializer that has an active PCLK input. LOCK is low if there is a serializer connected and there is a link established using the internal oscillator of the serializer. Therefore, when using this mode, it is preferred to use the port-specific LOCK\_STS register (0x4D[0]), which is high when linked to a serializer with internal oscillator. This LOCK\_STS signal can also be an output to a GPIO pin for monitoring in real time. Once LOCK\_STS is high for a specific port, remote I2C is available to that serializer. In RAW 10-bit mode, the LOCK pin is high when there is a link with a serializer regardless of whether there is an active PCLK input. The port-specific LOCK\_STS register is also valid in either of these modes.

If the deserializer loses LOCK, the receiver will reset and perform the LOCK algorithm again to reacquire the serial data stream sent by the serializer. The receive port will truncate video frames containing errors and resume forwarding the video when LOCK is re-established.

The Receive port will indicate Pass status once specific conditions are met, including a number of valid frames received. Valid frames may include requiring no link bit errors and consistent frame size including video line length or number of video lines. The receive port may be programmed to truncate video frames containing errors and prevent the forwarding of video until the Pass conditions are met.

#### 7.4.8 Input Jitter Tolerance

Input jitter tolerance is the ability of the Clock and Data Recovery (CDR) Phase-Lock Loop (PLL) of the receiver to track and recover the incoming serial data stream. Jitter tolerance at a specific frequency is the maximum jitter permissible before data errors occur. The following shows the allowable total jitter of the receiver inputs and must be less than the values in the chart.

Figure 7-4. Input Jitter Tolerance Plot

Table 7-5. Input Jitter Tolerance Limit

INTERFACE	JITTER AMPLITUDE (UI p-p)		FREQUENCY (MHz) (1)			
FPD-Link III	A1	A2	f1	f2		
FFD-LIIK III	1	0.4	FPD3_PCLK / 80	FPD3_PCLK / 15		

(1) FPD3\_PCLK is proportional to REFCLK, CSI-2 or PCLK frequency based on the operating MODE (Section 7.4):

RAW 10-bit mode: PCLK\_Freq. / 2 RAW 12-bit mode: PCLK\_Freq. x 2/3

#### 7.4.9 Adaptive Equalizer

The FPD-Link III receiver inputs incorporates an adaptive equalizer (AEQ), to compensate for signal degradation from the communications channel and interconnect components. Each RX port signal path continuously monitors cable characteristics for long-term cable aging and temperature changes. The AEQ is primarily intended to adapt and compensate for channel losses over the lifetime of a cable installed in an automobile. The AEQ attempts to optimize the equalization setting of the RX receiver. This adaption includes compensating insertion loss from temperature effects and aging degradation due to bending and flexion. To determine the maximum cable reach, factors that affect signal integrity such as jitter, skew, inter-symbol interference (ISI),

crosstalk, and so forth, must also be considered. The equalization configuration and status are programmed in registers 0xD2–0xD3 (see Table 7-159).

#### 7.4.9.1 Adaptive Equalizer Algorithm

The AEQ process steps through allowed values of the equalizer controls find a value that allows the Clock Data Recovery (CDR) circuit to maintain valid lock condition. For each EQ setting, the circuit waits for a programmed re-lock time period, then checks results for valid lock. If valid lock is detected, the circuit will stop at the current EQ setting and maintain constant value as long as lock state persists. If the deserializer loses LOCK, the adaptive equalizer will resume the LOCK algorithm and the EQ setting is incremented to the next valid state. Once lock is lost, the circuit will continue searching EQ settings to find a valid setting to reacquire the serial data stream sent by the serializer that remains locked.

#### 7.4.9.2 AEQ Settings

### 7.4.9.2.1 AEQ Start-Up and Initialization

The AEQ circuit can be restarted at any time by setting the AEQ\_RESTART bit in the AEQ\_CTL2 register 0xD2 (see Table 7-159). Once the deserializer is powered on, the AEQ is continually searching through EQ settings and could be at any setting when signal is supplied from the serializer. If the Rx Port CDR locks to the signal, it may be good enough for low bit errors, but could be not optimized or over-equalized. The DS90UB936-Q1 when connected to a ADAS serializer ( DS90UB935-Q1, DS90UB933-Q1, or DS90UB913A-Q1) will by default restart the AEQ adaption upon achieving first positive lock indication to provide more consistent start-up from known conditions. With this feature disabled, the AEQ may lock at a relatively random EQ setting based on when the FPD-Link III input signal is initially present. Alternatively, AEQ\_RESTART or DIGITAL\_RESET0 could be applied once the ADAS serializer input signal frequency is stable to restart adaption from the minimum EQ gain value. These techniques allow for a more consistent initial EQ setting following adaption.

#### 7.4.9.2.2 AEQ Range

AEQ Min/Max settings: The AEQ circuit can be programmed with minimum and maximum settings used during the EQ adaption. Using the full AEQ range will provide the most flexible solution, however if the channel conditions are known an improved deserializer lock time can be achieved by narrowing the search window for allowable EQ gain settings. For example in a system use case with a longer cable and multiple interconnects creating higher channel attenuation, the AEQ would not adapt to the minimum EQ gain settings. Likewise in a system use case with short cable and low channel attenuation AEQ would not generally adapt to the highest EQ gain settings. The AEQ range is determined by the AEQ\_MIN\_MAX register 0xD5 (see Section 7.6.144) where AEQ\_MAX sets the maximum value of EQ gain. The ADAPTIVE\_EQ\_FLOOR\_VALUE determines the starting value for EQ gain adaption. To enable the minimum AEQ limit, SET\_AEQ\_FLOOR bit in the AEQ\_CTL2 register 0xD2[2] must also be set. An AEQ range (AEQ\_MAX - AEQ\_FLOOR) to allow a variation around the nominal setting of -2/+4 or ±3 around the nominal AEQ value specific to Rx port channel characteristics provides a good trade off in lock time and adaptability. The setting for the AEQ after adaption can be readback from the AEQ STATUS register 0xD3 (see Section 7.6.142).

#### 7.4.9.2.3 AEQ Timing

The dwell time for AEQ to wait for lock or error free status is also programmable. When checking each EQ setting the AEQ will wait for a time interval, controlled by the ADAPTIVE\_EQ\_RELOCK\_TIME field in the AEQ\_CTL2 register (see Table 7-159) before incrementing to the next allowable EQ gain setting. The default wait time is set to 2.62 ms based on REFCLK = 25 MHz. Once the maximum setting is reached, if there is no lock acquired during the programmed relock time, the AEQ will restart adaption at the minimum setting or AEQ\_FLOOR value.

#### 7.4.9.2.4 AEQ Threshold

The DS90UB936-Q1 receiver will by default adapt based on FPD-Link error checking during the Adaptive Equalization process. The specific errors linked to equalizer adaption, FPD-Link III clock recovery error, packet encoding error, and parity error can be individually selected in AEQ\_CTL1 register 0x42 (see *Section 7.6.63*). Errors are accumulated over 1/2 of the period of the timer set by the ADAPTIVE\_EQ\_RELOCK\_TIME. If the number of errors is greater than the programmed threshold (AEQ\_ERR\_THOLD), the AEQ will attempt to increase the EQ setting.

### 7.4.10 Channel Monitor Loop-Through Output Driver (CMLOUT)

The DS90UB936-Q1 includes an internal **C**hannel **M**onitor **L**oop-through output on the CMLOUTP and CMLOUTN pins. A buffered loop-through output driver is provided on the CMLOUTP and CMLOUTN for observing jitter after equalization for each of the two RX receive channels. The CMLOUT monitors the post EQ stage thus providing the recovered input of the deserializer signal. The measured serial data width on the CMLOUT loop-through is the total jitter including the internal driver, AEQ, back channel echo, and so forth. Each channel also has its own CMLOUT monitor and can be used for debug purposes. This CMLOUT is useful in identifying gross signal conditioning issues.

Table 7-7 includes details on selecting the corresponding RX receiver of CMLOUTP and CMLOUTN configuration. To disable the CMLOUT, either follow the instructions in table to reload register default values, or reset the DS90UB936-Q1.

**Table 7-6. CML Monitor Output Driver** 

	PARAMETER	TEST CONDITIONS	PIN	MIN	TYP	MAX	UNIT
E <sub>W</sub>	Differential Output Eye Opening	R <sub>L</sub> = 100 Ω (Figure 7-5)	CMLOUTP, CMLOUTN	0.45			UI <sup>(1)</sup>

(1) UI – Unit Interval is equivalent to one ideal serialized FPD-Link III data bit width. The UI scales with serializer input PCLK frequency. Refer to the serializer datasheets for more PCLK information

CSI-2 mode: 1 UI = 1 / (PCLK\_Freq x 40) (typical) 10-bit mode: 1 UI = 1 / ( PCLK\_Freq. / 2 × 28) 12-bit mode: 1 UI = 1 / ( PCLK\_Freq. × 2 / 3 × 28)

```

#### 7.4.11 RX Port Status

In addition to the Lock and PASS indications, the deserializer is able to monitor and detect several other RX port-specific conditions and interrupt states. This information is latched into the RX port status registers RX\_PORT\_STS1 (0x4D) and RX\_PORT\_STS2 (0x4E). There are bits to flag any change in LOCK status (LOCK\_STS\_CHG) or detect any errors in the control channel over the forward link (BCC\_CRC\_ERROR, BCC\_SEQ\_ERROR) which are cleared upon read. The Rx Port status registers also allow the user to monitor the presence of the stable input signal, along with parity and CRC errors, line length, and lines per video frame.

#### 7.4.11.1 RX Parity Status

The FPD-Link III receiver checks the decoded data parity to detect any errors in the received FPD-Link III frame. Parity errors are counted up and accessible through the RX\_PAR\_ERR\_HI and RX\_PAR\_ERR\_LO registers 0x55 and 0x56 to provide combined 16-bit error counter. In addition, a parity error flag can be set once a programmed number of parity errors have been detected. This condition is indicated by the PARITY\_ERROR flag in the RX\_PORT\_STS1 register. Reading the counter value will clear the counter value and PARITY\_ERROR flag. An interrupt may also be generated based on assertion of the parity error flag. By default, the parity error counter will be cleared and the flag will be cleared on loss of Receiver lock. To ensure an exact read of the parity error counter, parity checking should be disabled in the GENERAL\_CFG register 0x02 before reading the counter.

#### 7.4.11.2 FPD-Link Decoder Status

The FPD-Link III receiver also checks the decoded data for encoding or sequence errors in the received FPD-Link III frame. If either of these error conditions are detected the FPD3\_ENC\_ERROR bit will be latched in the RX\_PORT\_STS2 register 0x4E[5]. An interrupt may also be generated based on assertion of the encoded error flag. To detect FPD-Link III Encoder errors, the LINK ERROR COUNT must be enabled with

a LINK\_ERR\_THRESH value greater than 1. Otherwise, the loss of Receiver Lock will prevent detection of the Encoder error. The FPD3 ENC ERROR flag is cleared on read.

When partnered with a DS90UB935-Q1, the FPD3 Encoder may be configured to include a CRC check of the FPD3 encoder sequence. The CRC check provides an extra layer of error checking on the encoder sequence. This CRC checking adds protection to the encoder sequence used to send link information comprised of Datapath Control (registers 0x59 and 0x5A), Sensor Status (registers 0x51-0x54), and Serializer ID (register 0x5B). TI recommends enabling the CRC error checking on the FPD3 Encoder sequence to prevent any updates of link information values from encoded packets that do not pass CRC check. The FPD3 Encoder CRC is enabled by setting the FPD3\_ENC\_CRC\_DIS (register 0xBA[7] Table 7-151) to 0. In addition, the FPD3 ENC CRC CAP flag should be set in register 0x4A[4] (see Section 7.6.66).

### 7.4.11.3 RX Port Input Signal Detection

The DS90UB936-Q1 can detect and measure the approximate input frequency and frequency stability of each RX input port and indicate status in bits [2:1] of RX\_PORT\_STS2. Frequency measurement stable FREQ\_STABLE indicates the FPD-Link III input clock frequency is stable. When no FPD-Link III input clock is detected at the RX input port the CABLE\_FAULT bit indicates that condition has occurred. Setting of these error flags is dependent on the stability control settings in the FREQ\_DET\_CTL register 0x77. The CABLE\_FAULT bit will be set if the input frequency is below the setting programmed in the FREQ\_LO\_THR setting in the FREQ\_DET\_CTL register. A change in frequency FREQ\_STABLE = 0, is defined as any change in MHz greater than the value programmed in the FREQ\_HYST value. The frequency is continually monitored and provided for readback through the I2C interface less than every 1 ms. A 16-bit value is used to provide the frequency in units of 2 to 8 MHz. An interrupt can also be generated for any of the ports to indicate if a change in frequency is detected on any port.

#### 7.4.11.4 Line Counter

For each video frame received, the deserializer will count the number of video lines in the frame. In CSI-2 input mode, any long packet will be counted as a video line. In RAW mode, any assertion of the Line Valid (LV) signal will be interpreted as a video line. The LINE\_COUNT\_1 and LINE\_COUNT\_0 registers in 0x73 and 0x74 can be used to read the line count for the most recent video frame. Line Length may not be consistent when receiving multiple CSI-2 video streams differentiated by VC-ID. An interrupt may be enabled based on a change in the LINE\_COUNT value. If interrupts are enabled, the LINE\_COUNT registers will be latched at the interrupt and held until read back by the processor through I2C.

#### 7.4.11.5 Line Length

For each video line, the length (in bytes) will be determined. The LINE\_LEN\_1 and LINE\_LEN\_0 registers 0x75 and 0x76 can be used to read the line count for the most recent video frame. If the line length is not stable throughout the frame, the length of the last line of the frame will be reported. Line Count may not be consistent when receiving multiple CSI-2 video streams differentiated by VC-ID. An interrupt may be enabled based on a change in the LINE\_LEN value. If interrupts are enabled, the LINE\_LEN registers will be latched at the interrupt and held until read by the processor through I2C.

#### 7.4.12 Sensor Status

When paired with the DS90UB935-Q1 serializer, the DS90UB936-Q1 is capable of receiving diagnostic indicators from the serializer. The sensor alarm and status diagnostic information are reported in the SENSOR\_STS\_X registers (0x51 to 0x54 in Table 7-92). The interrupt capability from detected status changes in sensor are described in Section 7.5.8.2.2. Sensor Status This interrupt condition will be cleared by reading the SEN\_INT\_RISE\_STS and SEN\_INT\_FALL\_STS registers (registers 0xDE and 0xDF).

#### 7.4.13 GPIO Support

In addition to the dedicated LOCK and PASS output pins, the DS90UB936-Q1 supports seven pins, GPIO0 through GPIO6, which can be monitored, configured, and controlled through I2C in registers 0x0E - 0x16. GPIO3 programmable I/O pin is an active-low open drain and is shared with INTB. The current status of all GPIO can be readback from register 0x0E. Each GPIO is programmable for multiple uses options through the GPIOx\_PIN\_CTL registers 0x10 - 0x16.

### 7.4.13.1 GPIO Input Control and Status

Upon initialization GPIO0 through GPIO6 are enabled as inputs by default. Each GPIO pin has an input disable and a pulldown disable control bit, with the exception of GPIO3 which is open drain. By default, the GPIO pin input paths are enabled and the internal pulldown circuit for the GPIO is enabled. The GPIO\_INPUT\_CTL (0x0F) and GPIO\_PD\_CTL (0xBE) registers allow control of the input enable and the pulldown, respectively. For example, to disable GPIO1 and GPIO2 as inputs the user would program in register 0x0F[2:1] = 11. For most applications, there is no need to modify the default register settings for the pulldown resistors. The status HIGH or LOW of each GPIO pin 0 through 6 may be read through the GPIO\_PIN\_STS register 0x0E. This register read operation provides the status of the GPIO pin independent of whether the GPIO pin is configured as an input or output.

#### 7.4.13.2 GPIO Output Pin Control

Individual GPIO output pin control is programmable through the GPIOx\_PIN\_CTL registers 0x10 to 0x16 (Table 7-35). To enable any of the GPIO as output, set bit 0 = 1 in the respective register 0x10 to 0x16 after clearing the corresponding input enable bit in register 0x0F (Table 7-34). The configuration register for each GPIO is listed in Table 7-8.

# 7.4.13.4 Forward Channel GPIO

The DS90UB936-Q1 has seven GPIO pins that can output data received from the forward channel when paired with the DS90UB935-Q1 serializer. The remote Serializer GPIO are mapped to GPIO. Each GPIO pin can be

programmed for output mode and mapped. Up to four GPIOs are supported in the forward direction on each FPD-Link III Receive port (see Table 7-99). Each forward channel GPIO (from any port) can be mapped to any GPIO output pin. The DS90UB933-Q1 and DS90UB913A-Q1 GPIOs cannot be configured as inputs for remote communication over the forward channel to the DS90UB936-Q1.

The timing for the forward channel GPIO is dependant on the number of GPIOs assigned at the serializer. When a single GPIO input from the DS90UB935-Q1 serializer is linked to a DS90UB936-Q1 deserializer, the GPIO output value is sampled every forward channel transmit frame. Two linked GPIO are sampled every two forward channel frames and three or four linked GPIO are sampled every five frames. The typical minimum latency for the GPIO remains consistent (approximately 225 ns), but as the information gets spread over multiple frames, the jitter is typically increased on the order of the sampling period (number of forward channel frames). TI recommends maintaining a 4x oversampling ratio for linked GPIO throughput. For example, when operating in 4-Gbps synchronous mode with REFCLK = 25 MHz, the maximum recommended GPIO input frequency based on the number of GPIO linked over the forward channel is shown in Table 7-9.

Table 7-9. Forward Channel GPIO Typical Timing

NUMBER OF LINKED FORWARD CHANNEL GPIOS (FC_GPIO_EN Table 7-99)	SAMPLING FREQUENCY (MHz) AT FPD-Link III LINE RATE = 4 Gbps	MAXIMUM RECOMMENDED FORWARD CHANNEL GPIO FREQUENCY (MHz)	TYPICAL JITTER (ns)
1	100	25	12
2	50	12.5	24
4	20	5	60

In addition to mapping remote serializer GPI, an internally generated FrameSync (see *Section 7.4.27*) or other control signals may be output from any of the deserializer GPIOs for synchronization with a local processor or another deserializer.

### 7.4.13.5 Back Channel GPIO

Each DS90UB936-Q1 GPIO pin defaults to input mode at start-up. The deserializer can link GPIO pin input data on up to four available slots to send on the back channel per each remote serializer connection. Any of the seven GPIO pin data can be mapped to send over the available back channel slots for each FPD-Link III Rx port. The same GPIO on the deserializer pin can be mapped to multiple back channel GPIO signals. For each 50-Mbps back channel operation, the frame period is 600 ns (30 bits × 20 ns/bit). For each 2.5-Mbps back channel , the frame period is 12  $\mu$ s (30 bits × 400 ns/bit). As the back channel GPIOs are sampled and sent each back channel frame by the DS90UB936-Q1 deserializer, the latency and jitter timing are each on the order of one back channel frame. The back channel GPIO is effectively sampled at a rate of 1/30 of the back channel rate or 1.67 MHz at  $f_{BC}$  = 50 Mbps. TI recommends that the input to back channel GPIO switching frequency is < 1/4 of the sampling rate or 416 kHz at  $f_{BC}$  = 50 Mbps. For example, when operating in 4-Gbps synchronous mode with REFCLK = 25 MHz, the maximum recommended GPIO input frequency based on the data rate when linked over the back channel is shown in Table 7-10.

Table 7-10. Back Channel GPIO Typical Timing

BACK CHANNEL RATE (Mbps)	SAMPLING FREQUENCY (kHz)	MAXIMUM RECOMMENDED BACK CHANNEL GPIO FREQUENCY (kHz)	TYPICAL LATENCY (us)	TYPICAL JITTER (us)
50	1670	416	1.5	0.7
10	334	83.5	3.2	3
2.5	83.5	20	12.2	12

In addition to sending GPIO from pins, an internally generated FrameSync or external FrameSync input signal may be mapped to any of the back channel GPIOs for synchronization of multiple sensors with extremely low skew. (see *Section 7.4.27*).

For each port, GPIO control is available through the BC\_GPIO\_CTL0 register 0x6E (see Table 7-120) and BC\_GPIO\_CTL1 register 0x6F (see Table 7-121).

### 7.4.13.6 Other GPIO Pin Controls

Each GPIO pin can has a input disable and a pulldown disable. By default, the GPIO pin input paths are enabled and the internal pulldown circuit in the GPIO is enabled. The GPIO\_INPUT\_CTL register 0x0F and GPIO\_PD\_CTL register 0xBE allow control of the input enable and the pulldown respectively. For most applications, there is no need to modify the default register settings.

### 7.4.14 Line Valid and Frame Valid Indicators

The FrameValid (FV) and LineValid (LV) indications from the Receive Port indicate approximate frame and line boundaries at the FPD-Link III Receiver input. These signals may not be accurate if the receiver is in CSI-2 input mode and multiple video streams are present at the Receive Port input. A common example of this scenario would be multiple Virtual Channel IDs received on a single port.

When the receiver is in one of the Raw modes the LV and FV provides controls for the video framing. The FV is equivalent to a Vertical Sync (VSYNC) while the LineValid is equivalent to a Horizontal Sync (HSYNC) input to the DS90UB933A-Q1 and DS90UB913A-Q1 device (see Section 7.4.27).

The DS90UB936-Q1 allows setting the polarity of these signals by register programming. The FV and LV polarity are controlled on a per-port basis and can be independently set in the PORT CONFIG2 register 0x7C.

To prevent false detection of FrameValid, FV must be asserted for a minimum number of clocks prior to first video line to be considered valid. The minimum FrameValid time is programmable in the FV\_MIN\_TIME register 0xBC. Because the measurement is in FPD-Link III clocks, the minimum FrameValid setup to LineValid timing at the Serializer will vary based on the RAW input operating mode.

A minimum FV to LV timing is required when processing RAW video frames at the serializer input. If the FV to LV minimum setup is not met (by default), the first video line is discarded. Optionally, a register control (PORT\_CONFIG:DISCARD\_1ST\_ON\_ERR) forwards the first video line missing some number of pixels at the start of the line.

Figure 7-7. Minimum FV to LV

Table 7-11. Minimum FV to LV Setu	o Requirement (in RAW Mode	Serializer FPD-Link III PCLKs)

MODE	FV_MIN_TIME CONVERSION FACTOR	ABSOLUTE MIN (FV_MIN_TIME = 0)	DEFAULT (FV_MIN_TIME = 128)
RAW12 HF	1.5	3	195
RAW10	2	5	261

For other settings of FV\_MIN\_TIME, the required FV to LV setup in Serializer PCLKs can be determined by:

Absolute Min + (FV MIN TIME × Conversion factor)

### 7.4.15 CSI-2 Protocol Layer

The DS90UB936-Q1 implements High-Speed mode to forward CSI-2 Low Level Protocol data. This includes features as described in the Low Level Protocol section of the MIPI CSI-2 Specification. It supports short and long packet formats.

The feature set of the protocol layer implemented by the CSI-2 TX is:

- Transport of arbitrary data (payload-independent)
- 8-bit word size
- Support for up to four interleaved virtual channels on the same link
- · Special packets for frame start, frame end, line start and line end information
- · Descriptor for the type, pixel depth and format of the Application Specific Payload data
- · 16-bit Checksum Code for error detection

Figure 7-8 shows the CSI-2 protocol layer with short and long packets.

### DATA:

Figure 7-8. CSI-2 Protocol Layer With Short and Long Packets

## 7.4.16 CSI-2 Short Packet

The short packet provides frame or line synchronization. Figure 7-9 shows the structure of a short packet. A short packet is identified by data types 0x00 to 0x0F.

**32-bit SHORT PACKET (SH)** Data Type (DT) = 0x00 - 0x0F

Figure 7-9. CSI-2 Short Packet Structure

### 7.4.17 CSI-2 Long Packet

A long packet consists of three elements: a 32-bit packet header (PH), an application-specific data payload with a variable number of 8-bit data words, and a 16-bit packet footer (PF). The packet header is further composed of three elements: an 8-bit data identifier, a 16-bit word count field, and an 8-bit ECC. The packet footer has one element, a 16-bit checksum. Figure 7-10 shows the structure of a long packet.

Figure 7-10. CSI-2 Long Packet Structure

Table 7-12. CSI-2 Long Packet Structure Description

PACKET PART FIELD NAME		SIZE (BIT)	DESCRIPTION
	VC / Data ID	8	Contains the virtual channel identifier and the data-type information.
Header	Word Count	16	Number of data words in the packet data. A word is 8 bits.
	ECC	8	ECC for data ID and WC field. Allows 1-bit error recovery and 2-bit error detection.
Data	Data	WC × 8	Application-specific payload (WC words of 8 bits).
Footer	Checksum	16	16-bit cyclic redundancy check (CRC) for packet data.

### 7.4.18 CSI-2 Data Type Identifier

The DS90UB936-Q1 MIPI CSI-2 protocol interface transmits the data identifier byte containing the values for the virtual channel ID (VC) and data type (DT) for the application specific payload data, as shown in Figure 7-11. The virtual channel ID is contained in the 2 MSBs of the data identifier byte and identify the data as directed to one of four virtual channels. The value of the data type is contained in the six LSBs of the data identifier byte. When partnered with a DS90UB935-Q1 serializer, the Data Type is passed through from the received CSI-2 packets. When partnered with DS90UB933-Q1 or DS90UB913A-Q1 the received RAW mode data is converted to CSI-2 Tx packets with assigned data type and virtual channel ID and matches what is sent by the video source.

DVP format serializer inputs must have discrete synch signals. When interfacing with DS90UB9x3x-Q1 serializers, the DS90UB936-Q1 utilizes the HSYNC and VSYNC inputs to construct the MIPI CSI-2 Tx data packets. When paired with a DVP serializer, the DS90UB936-Q1deserializer supports RAW8, RAW10 or RAW12 as well as formats which have the same pixel packing as RAW8, RAW10 or RAW12 such as YUV-422.

For each RX Port, registers define with which virtual channel and data type the RAW data context is associated:

- For FPD Receiver port operating in RAW input mode connected to a DS90UB933-Q1 or DS90UB913A-Q1 serializer, register 0x70 (see Table 7-122) describes RAW10 Mode and 0x71 (see Table 7-123) RAW12 Mode.
- RAW1x\_VC[7:6] field defines the associated virtual ID transported by the CSI-2 protocol from the sensor.
- RAW1x\_ID[5:0] field defines the associated data type. The data type is a combination of the data type transported by the CSI-2 protocol.

Figure 7-11. CSI-2 Data Identifier Structure

### 7.4.19 Virtual Channel and Context

The CSI-2 protocol layer transports virtual channels. The purpose of virtual channels is to separate different data flows interleaved in the same data stream. Each virtual channel is identified by a unique channel identification number in the packet header. Therefore, a CSI-2 TX context can be associated with a virtual channel and a data type. Virtual channels are defined by a 2-bit field. This channel identification number is encoded in the 2-bit code.

The CSI-2 TX transmits the channel identifier number and multiplexes the interleaved data streams. The CSI-2 TX supports up to four concurrent virtual channels.

## 7.4.20 CSI-2 Input Mode Virtual Channel Mapping

The CSI-2 Input mode (see Section 7.4.1) provides per-port Virtual Channel ID mapping. For each FPD-Link III input port, separate mapping may be done for each input VC-ID to any of four VC-ID values. The mapping is controlled by the VC\_ID\_MAP register 0x72 (see Table 7-124). This function sends the output as a time-multiplexed CSI-2 stream, where the video sources are differentiated by the virtual channel. The equivalent registers 0x70-0x71 can be used for mapping VC-IDs when operating in RAW FPD-Link III mode connected to DS90UB9x3x-Q1.

## 7.4.20.1 Example 1

The DS90UB936-Q1 is capable of receiving data from sensors attached to each port. Each port is sending a video stream using VC-ID of 0. The DS90UB936-Q1 can be configured to re-map the incoming VC-IDs to ensure each video stream has a unique ID. The direct implementation would map incoming VC-ID of 0 for RX Port 0, and VC-ID of 1 for RX Port 1.

Figure 7-12. VC-ID Mapping Example 1

## 7.4.20.2 Example 2:

The DS90UB936-Q1 is receiving two video streams from sensors on each input port. Each sensor is sending video streams using VC-IDs 0 and 1. Receive Port 0 maps the VC-IDs directly without change. Receive Port 1 maps the VC-IDs 0 and 1 to VC-IDs 2 and 3. This is required because each CSI-2 transmitter is limited to 4 VC-IDs per MIPI specification.

Figure 7-13. VC-ID Mapping Example 2

Figure 7-14. Two Sensor Data onto CSI-2 With Virtual Channels (VC-ID)

Figure 7-15. Two Sensor Data With Different Frame Size Replicated onto CSI-2 With Virtual Channels (VC-ID)

### 7.4.21 CSI-2 Transmitter Frequency

The CSI-2 Transmitters may operate nominally at 400 or 800 Mbps, 1.5 Gbps, or 1.6 Gbps. This operation is controlled through the CSI\_PLL\_CTL 0x1F register (see Table 7-50). The actual CSI-2 rate is proportional to the REFCLK frequency.

CSI_PLL_CTL[1:0]	CSI-2 TX DATA RATE PER LANE (Mbps)	REFCLK FREQUENCY (MHz)	NET CSI-2 VIDEO BANDWIDTH PER RX PORT (Gbps)
	1664	26	2.528
00	1600	25	2.528
	1472	23	2.528
01	Reserved	Reserved	Reserved
10	800	25	1.6 (RX Port 0 and RX Port 1)
11	400	25	0.8 (RX Port 0 and RX Port 1)

When configuring to 800 Mbps or 1.6 Gbps, the CSI-2 timing parameters are automatically set based on the CSI\_PLL\_CTL 0x1F register. In the case of alternate settings, the respective CSI-2 timing parameters registers must be programmed, and the appropriate override bit must be set. For the 1.664-Gbps and 1.472-Gbps options, these settings will also affect internal device timing for back channel operation, I2C, Bidirectional Control Channel, and FrameSync operation which scale with the REFCLK frequency. Net CSI-2 video bandwidth shown for CSI-2 TX frequency of 400 Mbps and 800 Mbps in Table 7-13 are for both RX ports enabled. When operating with a single RX port, the net CSI-2 video bandwidth can be up to 1.6 Gbps and 2.525 Gbps, respectively.

To operate CSI-2 at speed of 400-Mbps mode, set CSI\_PLL\_CTL to 11b (0x1F[1:0] =11) to enable 400-Mbps operation for the CSI-2 Transmitters. Internal PLL and Timers are then automatically adjusted for the reduced reference clock frequency. Software control of CSI-2 Transmitter timing registers is required to provide proper interface timing on the CSI-2 Output. The following are the recommended timer settings for 400-Mbps operation.

```
# Set CSI-2 Timing parameters
WriteI2C(0xB0,0x2)
                      # set auto-increment, page 0
WriteI2C(0xB1,0x40)
                      # CSI-2 Port 0
WriteI2C(0xB2,0x83)
                      # TCK Prep
WriteI2C(0xB2,0x8D)
                      # TCK Zero
WriteI2C(0xB2,0x87)
                      # TCK Trail
                      # TCK Post
WriteI2C(0xB2,0x87)
WriteI2C(0xB2,0x83)
                      # THS Prep
WriteI2C(0xB2,0x86)
                      # THS Zero
WriteI2C(0xB2,0x84)
                      # THS Trail
WriteI2C(0xB2,0x86)
                      # THS Exit
WriteI2C(0xB2,0x84)
                      # TLPX
```

### 7.4.22 CSI-2 Replicate Mode

In CSI-2 Replicate mode, both ports can be programmed to output the same data. The output from CSI-2 port 0 is also presented on CSI-2 port 1.

To configure this mode of operation, set the CSI\_REPLICATE bit in the FWD\_CTL2 register (Address 0x21 in Table 7-52). Enabling replicate mode will automatically enable the second CSI-2 Clock output signal. The CSI-2 transmitter must be programmed for one or two lanes only through the CSI\_LANE\_COUNT field in the CSI\_CTL register as only one or two lanes are supported.

### 7.4.23 CSI-2 Transmitter Output Control

Two register bits allow controlling the CSI-2 Transmitter output state. If the OUTPUT\_SLEEP\_STATE\_SELECT (OSS\_SEL) control is set to 0 in the GENERAL\_CFG 0x02 register (see Table 7-21), the CSI-2 Transmitter outputs are forced to the HS-0 state. If the OUTPUT\_ENABLE (OEN) register bit is set to 0 in the GENERAL\_CFG register, the CSI-2 pins are set to the high-impedance state.

For normal operation (OSS\_SEL and OEN both set to 1), activity on either of the Rx Port determines the state of the CSI-2 outputs. The CSI-2 Pin State during FPD-Link III inactive includes two options, controlled by the OUTPUT\_EN\_MODE bit in the GENERAL\_CFG register and FWD\_PORTx\_DIS in the FWD\_CTL1 register 0x20. If OUTPUT\_EN\_MODE is set to 0, a lack of activity will force the outputs to Hi-Z condition. If OUTPUT\_EN\_MODE is set to 1, or if the forwarding for the Rx Port is disabled (FWD\_PORTx\_DIS = 1), the output enters LP-11 state as there is no data available to the CSI-2 Transmitter input. The FPD-Link III inputs are considered active if the Receiver indicates valid lock to the incoming signal. For a CSI-2 TX port, lock is

considered valid if any Received port mapped to the TX port is indicating Lock. See section Section 7.4.6 for description of Rx port forwarding.

Table 7-14. CSI-2 Output Control Options

PDB pin	OSS_SEL	OEN	OUTPUT_O EN_MODE	FWD_PORTx_DIS	FPD-Link III INPUT	CSI-2 PIN STATE
0	Х	Х	Х	X	Χ	Hi-Z
1	0	Х	Х	X	Χ	HS-0
1	1	0	Х	Х	Х	Hi-Z
1	1	1	0	Х	All inactive	Hi-Z
1	1	1	1	Х	All inactive	LP-11
1	1	1	Х	1	Any active	LP-11
1	1	1	Х	0	Any active	Valid

### 7.4.24 CSI-2 Transmitter Status

The status of the CSI-2 Transmitter may be monitored by readback of the CSI\_STS register 0x35, or brought to one of the configurable GPIO pins as an output. The TX\_PORT\_PASS 0x35[0] indicates valid CSI-2 data being presented on CSI-2 port. If no data is being forwarded or if error conditions have been detected on the video data, the CSI-2 Pass signal will be cleared. The TX\_PORT\_SYNC 0x35[0] indicates the CSI-2 Tx port is able to properly synchronize input data streams from multiple sources. TX\_PORT\_SYNC will always return 0 if Synchronized Forwarding is disabled. Interrupts may also be generated based on changes in the CSI-2 port status.

### 7.4.25 Video Buffers

The DS90UB936-Q1 implements two video line buffer and FIFO, one for each RX channel. The video buffers provide storage of data payload and forward requirements for sending multiple video streams on the CSI-2 transmit ports. The total line buffer memory size is a 16-kB block for each RX port.

The CSI-2 transmitter waits for an entire packet to be available before pulling data from the video buffers.

### 7.4.26 CSI-2 Line Count and Line Length

The DS90UB936-Q1 counts the number of received lines (long packets) to determine line count on LINE\_COUNT\_1 and LINE\_COUNT\_0 registers 0x73-74. For received line length, DS90UB936-Q1 reads the number of bytes per line in LINE\_LEN\_1 and LINE\_LEN\_0 registers 0x75-0x76. Line Count and Line Length values are valid when receiving a single video stream. If multiple virtual channels are received on a FPD-Link III Receive port in CSI-2 input mode, the values in registers 0x73-74 may not be accurate

### 7.4.27 FrameSync Operation

A frame synchronization signal (FrameSync) can be sent through the back channel using any of the back channel GPIOs. The signal can be generated in two different methods. The first option offers sending the external FrameSync using one of the available GPIO pins on the DS90UB936-Q1 and mapping that GPIO to a back channel GPIO on one or two of the FPD-Link III ports.

The second option is to have the DS90UB936-Q1 internally generate a FrameSync signal to send through the back channel GPIO to one or two of the attached Serializers.

FrameSync signaling is synchronous on each of the two back channels. Thus, the FrameSync signal arrives at both of the serializers with limited skew.

## 7.4.27.1 External FrameSync Control

In External FrameSync mode, an external signal is input to the DS90UB936-Q1 through one of the GPIO pins on the device. The external FrameSync signal may be propagated to one or more of the attached FPD-Link III Serializers through a GPIO signal in the back channel. The expected skew timing for external FrameSynch mode is on the order of one back channel frame period or 600 ns when operating at 50 Mbps.

Figure 7-16. External FrameSync

Enabling the external FrameSync mode is done by setting the FS\_MODE control in the FS\_CTL register to a value between 0x8 (GPIO0 pin) to 0xE (GPIO6 pin). Set FS\_GEN\_ENABLE to 0 for this mode.

To send the FrameSync signal on a port's BC\_GPIOx signal, the BC\_GPIO\_CTL0 or BC\_GPIO\_CTL1 register should be programmed for that port to select the FrameSync signal.

Figure 7-17. External FrameSync With Two DS90UB936 Deserializers

### 7.4.27.2 Internally Generated FrameSync

In Internal FrameSync mode, an internally generated FrameSync signal is sent to one or more of the attached FPD-Link III Serializers through a GPIO signal in the back channel.

FrameSync operation is controlled by the FS\_CTL 0x18, FS\_HIGH\_TIME\_x, and FS\_LOW\_TIME\_x 0x19–0x1A registers. The resolution of the FrameSync generator clock (FS\_CLK\_PD) is derived from the back channel frame period (see BC\_FREQ\_SELECT[2:0] in Table 7-98). For example, each 50-Mbps back channel operation, the frame period is 600 ns (30 bits  $\times$  20 ns/bit), and for each 2.5-Mbps back channel , the frame period is 12  $\mu$ s (30 bits  $\times$  400 ns/bit).

Once enabled, the FrameSync signal is sent continuously based on the programmed conditions.

Enabling the internal FrameSync mode is done by setting the FS\_GEN\_ENABLE control in the FS\_CTL register to a value of 1. The FS\_MODE field controls the clock source used for the FrameSync generation. The FS\_GEN\_MODE field configures whether the duty cycle of the FrameSync is 50/50 or whether the high and low periods are controlled separately. The FrameSync high and low periods are controlled by the FS\_HIGH\_TIME and FS\_LOW\_TIME registers.

The accuracy of the internally generated FrameSync is directly dependent on the accuracy of the 25-MHz oscillator used as the reference clock and timing values should be scaled if reference other than 25 MHz is used.

Figure 7-18. Internal FrameSync

Figure 7-19. Internal FrameSync Signal

The following example shows generation of a FrameSync signal at 60 pulses per second. Mode settings:

- Programmable High/Low periods: FS GEN MODE 0x18[1]=0
- Use port 0 back channel frame period: FS\_MODE 0x18[7:4]=0x0
- Back channel rate of 50 Mbps: BC\_FREQ\_SELECT for port 0 0x58[2:0]=110b
- Initial FS state of 0: FS INIT STATE 0x18[2]=0

Based on mode settings, the FrameSync is generated based upon FS CLK PD of 600 ns.

The total period of the FrameSync is (1 / 60 hz) / 600 ns or approximately 27778 counts. The high time is programmed to 2778 and the low time is programmed to 25000.

Instruments www.ti.com

For a 10% duty cycle, set the high time to 2777 (0x0AD9) cycles, and the low time to 24999 (0x61A7) cycles:

- FS\_HIGH\_TIME\_1: 0x19=0x0A
- FS HIGH TIME 0: 0x1A=0xD9
- FS\_LOW\_TIME\_1: 0x1B=0x61
- FS\_LOW\_TIME\_0: 0x1C=0xA7

## 7.4.27.2.1 Code Example for Internally Generated FrameSync

```
WriteI2C(0x4C,0x01) # RX0

WriteI2C(0x1C,0xA7) # FS_LOW_TIME_0
WriteI2C(0x18,0x01) # Enable FrameSync
```

# 7.4.28 CSI-2 Forwarding

Video stream forwarding is handled by the forwarding control in the DS90UB936-Q1 on FWD\_CTL1 register 0x20. The forwarding control pulls data from the video buffers for each FPD-Link III RX port and forwards the data to the CSI-2 output interfaces. It also handles generation of transitions between LP and HS modes as well as sending of Synchronization frames. The forwarding control monitors each of the video buffers for packet and data availability.

Forwarding from input ports may be disabled using per-port controls. Each of the forwarding engines may be configured to pull data from either of the two video buffers, although both buffer may only be assigned to one CSI-2 Transmitter at a time unless in replicate mode. The two forwarding engines operate independently.

# 7.4.28.1 Enabling and Disabling the CSI-2 Transmitter

When CSI-2 Transmitter is enabled in CSI CTL register bit 0x33[0], by default the output will transition to LP11 state. Once enabled, it is typically best to leave the CSI-2 Transmitter enable, and only change the forwarding controls if changes are required to the system. When enabling and disabling the CSI-2 Transmitter, forwarding should be disabled to ensure proper start and stop of the CSI Transmitter.

When enabling and disabling the CSI-2 Transmitter, use the following sequence:

#### To Disable:

- 1. Disable forwarding for assigned ports in the FWD CTL1 register.
- 2. Disable CSI periodic calibration (if enabled) in the CSI\_CTL2 register.
- 3. Disable continuous clock operation (if enabled) in the CSI\_ CTL register.
- Clear CSI Transmit enable in CSI CTL register.

## To Enable:

- 1. Set CSI Transmit enable (and continuous clock if desired) in CSI\_CTL register.
- 2. Enable CSI periodic calibration (if desired) in the CSI CTL2 register.
- 3. Enable forwarding for assigned ports in the FWD CTL1 register.

### 7.4.28.2 Best-Effort Round Robin CSI-2 Forwarding

Best-Effort Round Robin (RR) CSI-2 Forwarding allows for combining sensor sources with different resolutions and timing to the same CSI-2 Tx output. By default, the RR forwarding of packets use standard CSI-2 method of video stream determination. No special ordering of CSI-2 packets are specified, effectively relying on the Virtual Channel Identifier (VC) and Data Type (DT) fields to distinguish video streams. Each image sensor is assigned a VC-ID to identify the source. Different data types within a virtual channel are also supported in this mode.

When receiving FPD-Link RAW packets from DS90UB9x3x-Q1, each image sensor is assigned a VC-ID to identify the source. Different data types within a virtual channel is also supported in this mode.

The forwarding engine forwards packets as they become available to the forwarding engine. In the case where multiple packets may be available to transmit, the forwarding engine typically operates in an RR fashion based on the input port from which the packets are received.

Best-effort CSI-2 RR forwarding has the following characteristics and capabilities:

- · Uses Virtual Channel ID to differentiate each video stream
- · Separate Frame Synchronization packets for each VC
- · No synchronization requirements

This mode of operation allows input RX ports to have different video characteristics and there is no requirement that the video be synchronized between ports. The attached video processor would be required to properly decode the various video streams based on the VC and DT fields.

Best-effort forwarding is enabled by setting the CSIx RR FWD bits in the FWD CTL2 register 0x21.

### 7.4.28.3 Synchronized Forwarding

In cases with multiple input sources, synchronized forwarding offers synchronization of all incoming data stored within the buffer. If packets arrive within a certain window, the forwarding control may be programmed to attempt to synchronize the video buffer data. In this mode, it attempts to send each channel synchronization packets in order (VC0, VC1) as well as sending packet data in the same order. In the following sections, Sensor A (SA) and Sensor B (SB) refer to the sensors connected at FPD-Link III RX port 0, and RX port 1, respectively. The following describe only the 2-port operation, but single port configuration also can be applied.

The forwarding engine for the CSI-2 Transmitter can be configured to synchronize both video sources.

# Requirements:

- · Video arriving at input ports should be synchronized within approximately one video line period
- All enabled ports should have valid, synchronized video
- Each port must have identical video parameters, including number and size of video lines, presence of synchronization packets, and so forth.

The forwarding engine attempts to send the video synchronized. If synchronization fails, the CSI-2 transmitter stops forwarding packets and attempt to restart sending synchronized video at the next FrameStart indication. Packets are discarded as long as the forwarding engine is unable to send the synchronized video.

Status is provided to indicate when the forwarding engine is synchronized. In addition, a flag is used to indicate that synchronization has been lost (status is cleared on a read).

Three options are available for Synchronized forwarding:

- Basic Synchronized forwarding
- Line-Interleave forwarding
- Line-Concatenated forwarding

Synchronized forwarding modes are selected by setting the CSIx\_SYNC\_FWD controls in the FWD\_CTL2 register. To enable synchronized forwarding the following order of operations is recommended:

- 1. Disable Best-effort forwarding by clearing the CSIx RR FWD bits in the FWD CTL2 register
- 2. Enable forwarding per Receive port by clearing the FWD\_PORTx\_DIS bits in the FWD\_CTL1 register
- 3. Enable Synchronized forwarding in the FWD CTL2 register

# 7.4.28.4 Basic Synchronized Forwarding

During Basic Synchronized Forwarding, each forwarded frame is an independent CSI-2 video frame including FrameStart (FS), video lines, and FrameEnd (FE) packets. Each forwarded stream may have a unique VC ID. If the forwarded streams do not have a unique VC-ID, the receiving process may use the frame order to differentiate the video stream packets.

The forwarding engine attempts to send the video synchronized. If synchronization fails, the CSI-2 transmitter stops forwarding packets and attempts to restart sending synchronized video at the next FS indication. Packets are discarded as long as the forwarding engine is unable to send the synchronized video.

Example Synchronized traffic to CSI-2 Transmit port at start of frame:

 $\mathsf{FS\_A} - \mathsf{FS\_B} - \mathsf{SA\_L1} - \mathsf{SB\_L1} \ \mathsf{SA\_L2} - \mathsf{SB\_L2} - \mathsf{SA\_L3} \dots$ 

Example Synchronized traffic to CSI-2 Transmit port at end of frame:

$$\dots$$
 SA\_LN - SB\_LN - FE\_A - FE\_B

Notes:

FS\_x FrameStart for Sensor X
FE\_x FrameEnd for Sensor X

Sx\_Ly
Line Y for Sensor X video frame
Sx\_LN
Last line for Sensor X video frame

Each packet includes the virtual channel ID assigned to receive port for each sensor.

### 7.4.28.4.1 Code Example for Basic Synchronized Forwarding

```
# Configure RX0 to map VC0 from data received on RX0 to VC0
WriteI2C(0x4C,0x01) # FPD3 PORT SEL
WriteI2C(0x72,0xE4) # CSI_VC_MAP

# Configure RX1 to map VC1 from data received on RX1 to VC1
WriteI2C(0x4C,0x12) # FPD3 PORT SEL
WriteI2C(0x70,0xE5) # CSI_VC_MAP

# Enable CSI Output and set 4 CSI lanes
WriteI2C(0x33,0x1) # CSI_CTL
# Enable synchronized basic forwarding for output port 0
WriteI2C(0x21,0x04) # FWD_CTL2
# Enable forwarding from RX0 and RX1
WriteI2C(0x20,0x00) # FWD_CTL1
```

KEY:

Figure 7-20. Basic Synchronized Format

FE - Frame End

LE - Line End

PF - Packet Footer + Filler (if applicable)

### 7.4.28.5 Line-Interleave Forwarding

In synchronized forwarding, the forwarding engine may be programmed to send only one of each synchronization packet. For example, if forwarding from both input ports, only one FS and FE packet is sent for each video frame. The synchronization packets for the other port is dropped. The video line packets for each video stream are sent as individual packets. This effectively merges the frames from N video sources into a single frame that has N times the number of video lines.

In this mode, all video streams must also have the same VC, although this is not checked by the forwarding engine. This is useful when connected to a controller that does not support multiple VCs. The receiving processor must process the image based on order of video line reception.

Example Synchronized traffic to CSI-2 Transmit port at start of frame:

Example Synchronized traffic to CSI-2 Transmit port at end of frame:

Notes:

FS\_x FrameStart for Sensor X
FE\_x FrameEnd for Sensor X

Sx\_Ly Line Y for Sensor X video frame
Sx\_LN Last line for Sensor X video frame

All packets would have the same VC ID.

### 7.4.28.5.1 Code Example for Line-Interleave Forwarding

```
# "*** RX0 VC=0 ***"
WriteI2C(0x4c,0x01) # RX0
WriteI2C(0x72,0xE8) # Map Sensor A VC0 to CSI-Tx VC0
# "*** RX1 VC=0 ***"
WriteI2C(0x4c,0x12) # RX1
WriteI2C(0x70,0xE8) # Map Sensor B VC0 to CSI-Tx VC0
# "CSI EN"
WriteI2C(0x33,0x1) # CSI_EN & CSIO 4L
# "*** CSIO_SYNC_FWD synchronous forwarding with line interleaving ***"
WriteI2C(0x21,0x28) # synchronous forwarding with line interleaving
# "*** FWD_PORT_all RX to CSIO"
WriteI2C(0x20,0x00) # forwarding of all RX to CSIO
```

\*Blanking intervals do not provide accurate synchronization timing

Figure 7-21. Line-Interleave Format

### 7.4.28.6 Line-Concatenated Forwarding

In synchronized forwarding, the forwarding engine may be programmed to merge video frames from multiple sources into a single video frame by concatenating video lines. Each of the sensors attached to each RX Port carry different data streams that get concatenated into one CSI-2 stream. For example, if forwarding from both input ports, only one FS an FE packet is sent for each video frame. The synchronization packets for the other port is dropped. In addition, the video lines from each sensor are combined into a single line. The controller must separate the single video line into the separate components based on position within the concatenated video line

Example Synchronized traffic to CSI-2 Transmit port at start of frame:

Example Synchronized traffic to CSI-2 Transmit port at end of frame:

Notes:

FS\_x FrameStart for Sensor X
FE\_x FrameEnd for Sensor X
Sx\_Ly Line Y for Sensor X video frame
Sx\_LN Last line for Sensor X video frame

SA\_L1,SB\_L1 indicate concatenation of the first video line from each Sensor into a single video line. This packet has a modified header and footer that matches the concatenated line data.

Packets would have the same VC ID, based on the VC ID for the lowest number Sensor port being forwarded.

Lines are concatenated on a byte basis without padding between video line data.

### 7.4.28.6.1 Code Example for Line-Concatenate Forwarding

```
# "*** RX0 VC=0 ***"
WriteI2C(0x4C,0x01) # RX0
WriteI2C(0x72,0xE8) # Map Sensor A VC0 to CSI-Tx VC0
# "*** RX1 VC=1 ***"

## 7.5 Programming

### 7.5.1 Serial Control Bus and Bidirectional Control Channel

The DS90UB936-Q1 implements an I2C-compatible serial control bus. The I2C is for local device configuration and incorporates a Bidirectional Control Channel (BCC) that allows communication across the FPD-Link cable with remote serializers as well as remote I2C target devices. The DS90UB936-Q1 implements an I2C compatible target capable of operation compliant to the Standard, Fast, and Fast-plus modes of operation. This allows I2C operation at up to 1-MHz clock frequencies. When paired with a DS90UB935-Q1 serializer the DS90UB936-Q1 supports combined format I2C read and write access. When paired with the DS90UB933-Q1 or DS90UB913A-Q1 serializers, all I2C remote writes must be terminated with a STOP rather than repeated START. The timing for the I2C interface is detailed in Figure 6-4.

For accesses to local registers, the I2C Target operates without stretching the clock. Accesses to remote devices over the Bidirectional Control Channel results in clock stretching to allow for response time across the link. The DS90UB936-Q1 can also act as I2C Controller for regenerating Bidirectional Control Channel accesses originating from the remote devices across FPD-Link. Set I2C\_CONTROLLER\_EN in register 0x02[5] = 1 to enable the proxy controller functionality of the deserializer.

### 7.5.1.1 Bidirectional Control

The Bidirectional Control Channel (BCC) supports higher frequency operation when attached to the DS90UB935-Q1 and is also backward compatible with the DS90UB933-Q1 or DS90UB913A-Q1 serializers. The Bidirectional Control Channel is compatible with I2C devices, allowing local I2C target access to device registers as well as bidirectional I2C operation across the link to the Serializer and attached devices. I2C access should not be attempted across the link when Rx Port Lock status is Low. In addition to providing BCC operation, the back channel signaling also supports GPIO operations and advertising device capabilities to the attached Serializer device. The default back channel frequency is selected by the strap setting of the MODE pin. Additional speeds are also available, controlled separately for each Rx Port through the BC\_FREQ\_SELECT register field in the BCC\_CONFIG register 0x58. Back channel frequency operates in 50-Mbps and 2.5-Mbps modes to support DS90UB935-Q1, and DS90UB933-Q1 or DS90UB913A-Q1 Serializers.

### 7.5.1.2 Device Address

The primary device address is set through a resistor divider ( $R_{HIGH}$  and  $R_{LOW}$  — see Figure 7-23 below) connected to the IDX pin. Note that the voltage of  $V_{I2C}$  must match the voltage of  $V_{VDDIO}$ . The DS90UB936-Q1 waits 1 ms after PDB goes high to allow time for power supply transients before sampling the IDX value and configuring the device to set the I2C address. The primary I2C target address is stored in the I2C Device ID register at address 0x0. In addition to the primary I2C target address, the DS90UB936-Q1 may be programmed to respond to up to 2 other I2C addresses. The two RX Port ID addresses provide direct access to the Receive Port 0 and Por1 registers without needing to set the paging controls normally required to access the port registers. In addition, these Rx port assigned I2C IDs also allow access to the shared registers in the same manner as the primary I2C target address. The I2C\_RX0\_ID and I2C\_RX1\_ID, registers are located in register address 0xF8 and 0xF9, respectively.

Figure 7-23. Serial Control Bus Connection

The IDX pin configures the control interface to one of eight possible device addresses. A pullup resistor and a pulldown resistor may be used to set the appropriate voltage ratio between the IDX input pin  $(V_{IDX})$  and  $V_{(VDD18)}$ , each ratio corresponding to a specific device address. See Table 7-15, Serial Control Bus Addresses for IDX.

NO	V <sub>ID</sub>	V <sub>IDX</sub> VOLTAGE RANGE		V <sub>IDX</sub> TARGET VOLTAGE	SUGGESTED STRAP RESISTORS (1% TOL)		PRIMARY ASSIGNED I2C ADDRESS

Table 7-15. Serial Control Bus Addresses for IDX

# 7.5.1.3 Basic I2C Serial Bus Operation

The serial control bus consists of two signals, SCL and SDA. SCL is a Serial Bus Clock Input. SDA is the Serial Bus Data Input / Output signal. Both SCL and SDA signals require an external pullup resistor to 1.8-V or 3.3-V nominal  $V_{12C}$ . For most applications, TI recommends a 4.7-k $\Omega$  pullup resistor to  $V_{12C}$ . However, the pullup resistor value may be adjusted for capacitive loading and data rate requirements. The signals are either pulled High or driven Low.

The Serial Bus protocol is controlled by START, START-Repeated, and STOP phases. A START occurs when SCL transitions Low while SDA is High. A STOP occurs when SDA transitions High while SCL is also HIGH. See Figure 7-24.

Figure 7-24. START and STOP Conditions

To communicate with a target device, the host controller (controller) sends the target address and listens for a response from the target. This response is referred to as an acknowledge bit (ACK). If a target on the bus is addressed correctly, it acknowledges (ACKs) the controller by driving the SDA bus low. If the address does not match the target address of the device, it not-acknowledges (NACKs) the controller by letting SDA be pulled High. ACKs also occur on the bus when data is being transmitted. When the controller is writing data, the target ACKs after every data byte is successfully received. When the controller is reading data, the controller ACKs after every data byte is received to let the target know it wants to receive another data byte. When the controller wants to stop reading, it NACKs after the last data byte and creates a stop condition on the bus. All communication on the bus begins with either a Start condition or a Repeated Start condition. All communication on the bus ends with a Stop condition. A READ is shown in Figure 7-25 and a WRITE is shown in Figure 7-26.

Figure 7-25. Serial Control Bus — READ

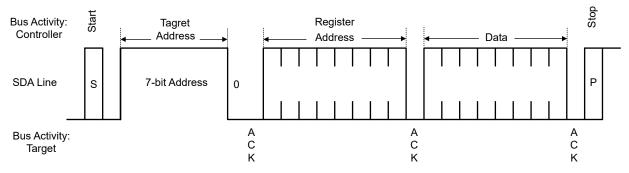

Figure 7-26. Serial Control Bus — WRITE

For more information on I2C interface requirements and throughput considerations, refer to *I2C Communication* Over FPD-Link III With Bidirectional Control Channel (SNLA131) and *I2C Over DS90UB913/4 FPD-Link III With Bidirectional Control Channel* (SNLA222).

## 7.5.2 I2C Target Operation

The DS90UB936-Q1 implements an I2C-compatible target capable of operation compliant to the Standard, Fast, and Fast-plus modes of operation allowing I2C operation at up to 1-MHz clock frequencies. Local I2C

www.ti.com

transactions to access DS90UB936-Q1 registers can be conducted 2 ms after power supplies are stable and PDB is brought high. For accesses to local registers, the I2C Target operates without stretching the clock. The primary I2C target address is set through the IDx pin. The primary I2C target address is stored in the I2C Device ID register at address 0x0. In addition to the primary I2C target address, the DS90UB936-Q1 may be programmed to respond to up to two other I2C addresses. The two RX Port ID addresses provide direct access to the Receive Port registers without needing to set the paging controls normally required to access the port registers.

# 7.5.3 Remote Target Operation

The Bidirectional control channel provides a mechanism to read or write I2C registers in remote devices over the FPD-Link III interface. The I2C Controller located at the Deserializer must support I2C clock stretching. Accesses to serializer or remote target devices over the Bidirectional Control Channel will result in clock stretching to allow for response time across the link. The DS90UB936-Q1 acts as an I2C target on the local bus, forwards read and write requests to the remote device, and returns the response from the remote device to the local I2C bus. To allow for the propagation and regeneration of the I2C transaction at the remote device, the DS90UB936-Q1 will stretch the I2C clock while waiting for the remote response. To communicate with a remote target device, the Rx Port which is intended for messaging also must be selected in register 0x4C. The I2C address of the currently selected RX Port serializer will be populated in register 0x5B of the DS90UB936-Q1. The BCC CONFIG register 0x58 also must have bit 6, I2C PASS THROUGH set to one. If enabled, local I2C transactions with valid address decode will then be forwarded through the Bidirectional Control Channel to the remote I2C bus. When I2C PASS THROUGH is set, the deserializer will only propagate messages that the DS90UB936-Q1 recognizes, such as the registered serializer alias address (SER ALIAS), or any registered remote target alias attached to the serializer I2C bus (TARGET ALIAS) assigned to the specific Rx Port0 or Port 1. Setting PASS THROUGH ALL and AUTO ACK are less common use cases and primarily used for debugging I2C messaging as they will respectively pass all addresses regardless of valid I2C address (PASS THROUGH ALL) and acknowledge all I2C commands without waiting for a response from serializer (AUTO ACK).

# 7.5.3.1 Remote I<sup>2</sup>C Targets Data Throughput

Since the BCC buffers each I<sup>2</sup>C data byte and regenerates the I<sup>2</sup>C protocol on the remote side of the link, the overall I<sup>2</sup>C throughput will be reduced. The reduction is dependent on the operating frequencies of the local and remote interfaces. The local I<sup>2</sup>C rate is based on the host controller clock rate, while the remote rate depends on the settings for the proxy I<sup>2</sup>C controller (SCL frequency).

For purposes of understanding the effects of the BCC on data throughput from a host controller to a remote I<sup>2</sup>C controller, the approximate bit rate including latency timings across the control channel can be calculated by the followina:

9 bits / ((Host bit \* 9) + (Remote bit \* 9) + FCdelay + BCCdelay)

Example of DS90UB935/936 chipset:

For the 100 kbit/s (100 kHz):

Host bit = 10us (100 kHz)

Remote bit = 13.5us (default 74 kHz)

FCdelay = 225ns (typical value)

BCCdelay = 1.5us (typical value for 50 Mbps back channel rate)

Effective rate = 9bits / (90us + 121us + 0.225us + 1.5us) = 42.3 kbit/s

Table 7-16. Typical Achievable Bit Rates

Host I2C rate	Remote I2C rate	Net bit rate
100 kbit/s	74 kbit/s (default settings)	42.3 kbit/s
400 kbit/s	100 kbit/s	78.8 kbit/s
1 Mbit/s	100 kbit/s	89.4 kbit/s
1 Mbit/s	400 kbit/s	270.88 kbit/s

Table 7-16. Typical Achievable Bit Rates (continued)

Host I2C rate	Remote I2C rate	Net bit rate	
1 Mbit/s	1 Mbit/s	456.27 kbit/s	

Since the I<sup>2</sup>C protocol includes overhead for sending address information as well as START and STOP bits, the actual data throughput depends on the size and type of transactions used. Use of large bursts to read and write data will result in higher data transfer rates.

## 7.5.4 Remote Target Addressing

Various system use cases require multiple sensor devices with the same fixed I2C target address to be remotely accessible from the same I2C bus at the deserializer. The DS90UB936-Q1 provides target ID virtual addressing to differentiate target target addresses when connecting two or more remote devices. Eight pairs of TargetAlias and TargetID registers are allocated for each FPD-Link III Receive port in registers 0x5C through 0x6C. The TargetAlias register allows programming a virtual address which the host controller uses to access the remote device. The TargetID register provides the actual target address for the device on the remote I2C bus. Since eight pairs of registers are available for each port (total of 16 pairs), multiple devices may be directly accessible remotely without need for reprogramming. Multiple TargetAlias can be assigned to the same TargetID as well.

## 7.5.5 Broadcast Write to Remote Target Devices

The DS90UB936-Q1 provides a mechanism to broadcast I2C writes to remote devices (either remote targets or serializers). For each Receive port, the TargetID and TargetAlias register pairs would be programmed with the same TargetAlias value so they would each respond to the local I2C access. The TargetID value would match the intended remote device address, either remote target or serializers. For each receive port, on of the TargetAlias registers is set with an Alias value. For each port, the TargetID value is set to the address of the remote device. These values may be the same. To access the remote serializer registers rather than a remote target, the serializer ID (SER\_IDX or SER\_IDY) would be used as the TargetID value.

### 7.5.5.1 Code Example for Broadcast Write

```
# "FPD3_PORT_SEL Boardcast RX0/1"
WriteI2C(0x4c,0x0f) # RX_PORT0 read; RX0/1 write
# "enable pass through"
WriteI2C(0x58,0x58) # enable pass through
WriteI2C(0x5c,0x18) # "SER_ALIAS_ID"
WriteI2C(0x5c,0x18) # "TargetID[0]"
WriteI2C(0x65,0x60) # "TargetAlias[0]"
WriteI2C(0x67,0x01) # "FV_POLARITY"
WriteI2C(0x70,0x1f) # RAWI0_datatype_yuv422b10_VC0
```

## 7.5.6 I2C Controller Proxy

The DS90UB936-Q1 implements an I2C controller that acts as a proxy controller to regenerate I2C accesses originating from a remote serializer (DS90UB935-Q1, DS90UB933-Q1, DS90UB913A-Q1). By default, the I2C Controller Enable bit (I2C\_CONTROLLER\_EN) in register 0x05[2]= 0 to block Controller access to local deserializer I2C from remote serializers. Set I2C\_CONTROLLER\_EN] = 1 if system requires the deserializer to act as proxy controller for remote serializers on the local deserializer I2C bus. The proxy controller is an I2C compatible controller, capable of operating with Standard-mode, Fast-mode, or Fast-mode Plus I2C timing. It is also capable of arbitration with other controllers, allowing multiple controllers and targets to exist on the I2C bus. A separate I2C proxy controller is implemented for each Receive port. This allows independent operation for all sources to the I2C interface. Arbitration between multiple sources is handled automatically using I2C multi-controller arbitration.

# 7.5.7 I2C Controller Proxy Timing

The proxy controller timing parameters are based on the REFCLK timing. Timing accuracy for the I2C proxy controller based on the REFCLK or XTL clock source attached to the DS90UB936-Q1 deserializer. Before REFCLK is applied the deserializer will default to internal reference clock with accuracy of 25 MHz ±10%. The I2C Controller regenerates the I2C read or write access using timing controls in the registers 0xA and 0xB to

www.ti.com

regenerate the clock and data signals to meet the desired I2C timing in standard, fast, or fast-plus modes of operation.

I2C Controller SCL High Time is set in register 0x0A[7:0]. This field configures the high pulse width of the SCL output when the Serializer is the Controller on the local deserializer I2C bus. The default value is set to provide a minimum 5-µs SCL high time with the reference clock at 25 MHz + 100 ppm including four additional oscillator clock periods or synchronization and response time. Units are 40 ns for the nominal oscillator clock frequency, giving Min delay =  $40 \text{ ns} \times (SCL \text{ HIGH TIME} + 4)$ .

I2C Controller SCL Low Time is set in register 0x0B[7:0]. This field configures the low pulse width of the SCL output when the Serializer is the Controller on the local deserializer I2C bus. This value is also used as the SDA setup time by the I2C Target for providing data prior to releasing SCL during accesses over the BiDirectional Control Channel. The default value is set to provide a minimum 5-µs SCL high time with the reference clock at 25 MHz + 100 ppm including four additional oscillator clock periods or synchronization and response time. Units are 40 ns for the nominal oscillator clock frequency, giving Min delay = 40 ns × (SCL HIGH TIME + 4). See Table 7-17 example settings for Standard mode, Fast mode, and Fast Mode Plus timing.

Table 7-17. Typical 120 Tilling Register Settings						
	SCL HIGH	TIME	SCL LOW TIME			
I2C MODE	0x0A[7:0]	NOMINAL DELAY AT REFCLK = 25 MHz	0v0R[7·0]	NOMINAL DELAY AT		
Standard	0x7A	5.04 us	0x7A	5.04 us		
Fast	0x13	0.920 us	0x25	1.64 us		
Fast - Plus	0x06	0.400 us	0x0C	0.640 us		

Table 7-17 Typical I2C Timing Register Settings

# 7.5.7.1 Code Example for Configuring Fast Mode Plus I2C Operation

```
"RX0 I2C Controller Fast Plus Configuration"
WriteI2C(0x02,0x3E) # Enable Proxy
WriteI2C(0x4c,0x01) # Select RX PORT0
# Set SCL High and Low Time delays
WriteI2C(0x0a,0x06) # SCL High
WriteI2C(0x0b,0x0C) # SCL Low
```

## 7.5.8 Interrupt Support

Interrupts can be brought out on the INTB pin as controlled by the INTERRUPT\_CTL 0x23 and INTERRUPT\_STS 0x24 registers. The main interrupt control registers provide control and status for interrupts from the individual sources. Sources include each of the two FPD-Link III Receive ports as well as the CSI-2 Transmit port. Clearing interrupt conditions requires reading the associated status register for the source. The setting of the individual interrupt status bits is not dependent on the related interrupt enable controls. The interrupt enable controls whether an interrupt is generated based on the condition, but does not prevent the interrupt status assertion.

The DS90UB936-Q1 devices have built in flexibility such that the main interrupt may be brought to any GPIO pin through the GPIOx\_PIN\_CTL register for that pin (see *Table 7-35*). Note that the GPIO3 pin is the only GPIO that is implemented as open-drain, so this is the preferred pin for signaling the interrupt.

For an interrupt to be generated based on one of the interrupt status assertions, both the individual interrupt enable and the INT\_EN control must be set in the INTERRUPT\_CTL 0x23 register. For example, to generate an interrupt if IS\_RX0 is set, both the IE\_RX0 and INT\_EN bits must be set. If IE\_RX0 is set but INT\_EN is not, the INT status is indicated in the INTERRUPT\_STS register, and the INTB pin does not indicate the interrupt condition.

See the INTERRUPT\_CTL 0x23 and INTERRUPT\_STS 0x24 registers for details.

# 7.5.8.1 Code Example to Enable Interrupts

```
# "RX0/1 INTERRUPT_CTL enable"
WriteI2C(0x23,0xBF) # RX all & INTB PIN EN
# Individual RX0/1 INTERRUPT_CTL enable
# "RX0 INTERRUPT_CTL enable"
WriteI2C(0x4C,0x01) # RX0
WriteI2C(0x23,0x81) # RX0 & INTB PIN EN
# "RX1 INTERRUPT_CTL enable"
WriteI2C(0x4C,0x12) # RX1
WriteI2C(0x23,0x82) # RX1
```

### 7.5.8.2 FPD-Link III Receive Port Interrupts

For each FPD-Link III Receive port, multiple options are available for generating interrupts. Interrupt generation is controlled through the PORT\_ICR\_HI 0xD8 and PORT\_ICR\_LO 0xD9 registers. In addition, the PORT\_ISR\_HI 0xDA and PORT\_ISR\_LO 0xDB registers provide read-only status for the interrupts. Clearing of interrupt conditions is handled by reading the RX\_PORT\_STS1, RX\_PORT\_STS2, and CSI\_RX\_STS registers. The status bits in the PORT\_ISR\_HI/LO registers are copies of the associated bits in the main status registers.

www.ti.com

To enable interrupts from one of the Receive port interrupt sources:

- 1. Enable the interrupt source by setting the appropriate interrupt enable bit in the PORT\_ICR\_HI or PORT ICR LO register
- 2. Set the RX Port X Interrupt control bit (IE RXx) in the INTERRUPT CTL register
- 3. Set the INT\_EN bit in the INTERRUPT\_CTL register to allow the interrupt to assert the INTB pin low

To clear interrupts from one of the Receive port interrupt sources:

- 1. (optional) Read the INTERRUPT STS register to determine which RX Port caused the interrupt
- (optional) Read the PORT ISR HI and PORT ISR LO registers to determine source of interrupt
- 3. Read the appropriate RX PORT STS1, RX PORT STS2, or CSI RX STS register to clear the interrupt.

The first two steps are optional. The interrupt could be determined and cleared by just reading the status registers.

# 7.5.8.2.1 Interrupts on Forward Channel GPIO

When connected to the DS90UB935-Q1 serializer, interrupts can be generated on changes in any of the four forward channel GPIOs per port. Interrupts are enabled by setting bits in the FC GPIO ICR register. Interrupts may be generated on rising and/or falling transitions on the GPIO signal. The GPIO interrupt status is cleared by reading the FC\_GPIO\_STS register.

Interrupts should only be used for GPIO signals operating at less than 10 MHz. High or low pulses that are less than 100 ns might not be detected at the DS90UB936-Q1. To avoid false interrupt indications, the interrupts should not be enabled until after the Forward Channel GPIOs are enabled at the serializer.

### 7.5.8.2.2 Interrupts on Change in Sensor Status

The FPD-Link III Receiver recovers 32-bits of Sensor status from the attached DS90UB935-Q1 serializer. Interrupts may be generated based on changes in the Sensor Status values received from the forward channel. The Sensor Status consists of 4 bytes of data, which may be read from the SENSOR STS x registers for each Receive port. Interrupts may be generated based on a change in any of the bits in the first byte (SENSOR STS 0). Each bit can be individually masked for Rising and/or Falling interrupts.

Two registers control the interrupt masks for the SENSOR STS bits: SEN INT RISE CTL and SEN INT FALL CTL.

Two registers provide interrupt status: SEN INT RISE STS, SEN INT FALL STS.

If a mask bit is set, a change in the associated SENSOR STS 0 bit will be detected and latched in the SEN\_INT\_RISE\_STS or SEN\_INT\_FALL\_STS registers. If the mask bit is not set, the associated interrupt status bit will always be 0. If any of the SEN INT RISE STS or SEN INT FALL STS bits is set, the IS FC SEN STS bit will be set in the PORT ISR HI register.

### 7.5.8.3 Code Example to Readback Interrupts

```
INTERRUPT STS = ReadI2C(0x24) # 0x24 INTERRUPT STS

### 7.5.8.4 CSI-2 Transmit Port Interrupts

The following interrupts are available for each CSI-2 Transmit Port:

- Pass indication
- Synchronized status

- Deassertion of Pass indication for an input port assigned to the CSI-2 TX Port
- Loss of Synchronization between input video streams
- RX Port Interrupt interrupts from RX Ports mapped to this CSI-2 Transmit port

See the CSI\_TX\_ICR address 0x36 and CSI\_TX\_ISR address 0x37 registers for details.

The setting of the individual interrupt status bits is not dependent on the related interrupt enable controls. The interrupt enable controls whether an interrupt is generated based on the condition, but does not prevent the interrupt status assertion.

### 7.5.9 Error Handling

In the DS90UB936-Q1, the FPD-Link III receiver transfers incoming video frames to internal video buffers for forwarding to the CSI-2 Transmit ports. When the DS90UB936-Q1 detects an error condition the standard operation would be to flag this error condition and truncate sending the CSI-2 frame to avoid sending corrupted data downstream. When the DS90UB936-Q1 recovers from an error condition, it will provide Start of Frame and resume sending valid data. Consequently, when the downstream CSI-2 input receives a repeated Start of Frame condition, this will indicate that the data received in between the prior start of frame is suspect and the signal processor can then discard the suspected data. The settings in registers PORT\_CONFIG2 (0x7C) and PORT PASS CTL (0x7D) can be used to change how the 936 handles errors when passing video frames. The receive ports may be configured to qualify the incoming video, providing a status indication and preventing forwarding of video frames until certain error free conditions are met. The Pass indication may be used to prevent forwarding packets to the internal video buffers by setting the PASS\_DISCARD\_EN bit in the PORT PASS CTL register. When this bit is set, video input will be discarded until the Pass signal indicates valid receive data. The Receive port will indicate Pass status once specific conditions are met including a number of valid frames received. Valid frames may include requiring no FPD-Link III Parity errors and consistent frame size including video line length and/or number of video lines.

In addition, the Receive port may be programmed to truncate video frames containing errors or prevent the forwarding of video until the Pass conditions are met. Register settings in PORT CONFIG2 register 0x7C can be used to truncate frames on different line/frame sizes or a CSI-2 parity error is detected. When the deserializer truncates frames in cases of different line/frame sizes different line/frame sizes, the video frame will stop immediately with no frame end packet. Often the condition will not be cleared until the next valid frame is received.

The Rx Port PASS indication may be used to prevent forwarding packets to the internal video buffers by setting the PASS\_DISCARD\_EN bit in the PORT\_PASS\_CTL register 0x7D. When this bit is set, video input will be discarded until the Pass signal indicates valid receive data. The incoming video frames may be truncated based on error conditions or change in video line size or number of lines. These functions are controlled by bits in the PORT CONFIG2 register. When truncating video frames, the video frame may be truncated after sending any number of video lines. A truncated frame will not send a Frame End packet to the CSI-2 Transmit port.

### 7.5.9.1 Receive Frame Threshold

The FPD-Link III Receiver may be programmed to require a specified number of valid video frames prior to indicating a Pass condition and forwarding video frames. The number of required valid video frames is programmable through the PASS\_THRESH field in the PORT\_PASS\_CTL register 0x7D (Table 7-135). The threshold can be programmed from 0 to 3 video frames. If set to 0, Pass will typically be indicated as soon as the FPD-Link III Receiver reports Lock to the incoming signal. If set greater than 0, the Receiver will require that number of valid frames before indicating Pass. Determination of valid frames will be dependent on the control bits in the PORT PASS CTL register. In the case of a Parity Error, when PASS PARITY ERR is set to 1 forwarding will be enabled one frame early. To ensure at least one good frame occurs following a parity error the counter should be set to 2 or higher when PASS\_PARITY\_ERR = 1.

## 7.5.9.2 Port PASS Control

When the PASS\_LINE\_SIZE control is set in the PORT\_PASS\_CTL register, the Receiver will qualify received frames based on having a consistent video line size. For PASS LINE SIZE to be clear, the deserializer checks that the received line length remains consistent during the frame and between frames. For each video line, the length (in bytes) will be determined. If it varies then we will flag this condition. Each video line in the packet must be the same size, and the line size must be consistent across video frames. A change in video line size will restart the valid frame counter.

When the PASS\_LINE\_CNT control is set in the PORT\_PASS\_CTL register, the Receiver will qualify received frames based on having a consistent frame size in number of lines. A change in number of video lines will restart the valid frame counter.

When the PASS\_PARITY\_ERR control is set in the PORT\_PASS\_CTL register, the Receiver will clear the Pass indication on receipt of a parity error on the FPD-Link III interface. The valid frame counter will also be cleared on the parity error event. When PASS\_PARITY\_ERR is set to 1, TI also recommends setting PASS\_THRESHOLD to 2 or higher to ensure at least one good frame occurs following a parity error.

### 7.5.10 Timestamp - Video Skew Detection

The DS90UB936-Q1 implements logic to detect skew between video signaling from attached Sensors. For each input port, the DS90UB936-Q1 provides the ability to capture a timestamp for both a start-of-frame and start-of-line event. Comparison of timestamps can provide information on the relative skew between the ports. Start-of-frame timestamps are generated at the active edge of the Vertical Sync signal in Raw mode. Start-of-line timestamps are generated at the start of reception of the Nth line of video data after the start-of-frame for either mode of operation. The function does not use the Line Start (LS) packet or Horizontal Sync controls to determine the start of lines. Timestamp operation is not supported if multiple video streams (Virtual Channels) are present on a single Rx port.

The skew detection can run in either a FrameSync mode or free-run mode.

Skew detection can be individually enabled for each RX port.

For start-of-line timestamps, a line number must be programmed. The same line number is used for all channels. Prior to reading timestamps, the TS\_FREEZE bit for each port that will be read should be set. This will prevent overwrite of the timestamps by the detection circuit until all timestamps have been read. The freeze condition will be released automatically once all frozen timestamps have been read. The freeze bits can also be cleared if it does not read all the timestamp values.

The TS STATUS register includes the following:

- Flags to indicate multiple start-of-frame per FrameSync period
- · Flag to indicate Timestamps Ready
- Flags to indicate Timestamps valid (per port) if ports are not synchronized, all ports may not indicate valid timestamps

The Timestamp Ready flag will be cleared when the TS FREEZE bit is cleared.

### 7.5.11 Pattern Generation

The DS90UB936-Q1 supports an internal pattern generation feature to provide a simple way to generate video test patterns for the CSI-2 transmitter outputs. Two types of patterns are supported: Reference Color Bar pattern and Fixed Color patterns and accessed by the Pattern Generator page 0 in the indirect register set.

Prior to enabling the Packet Generator, the following should be done:

- 1. Disable video forwarding by setting bits [5:4] of the FWD\_CTL1 register (that is, set register 0x20 to 0x30).
- 2. Configure CSI-2 Transmitter operating speed using the CSI PLL CTL register.
- 3. Enable the CSI-2 Transmitter for port 0 using the CSI\_CTL register

## 7.5.11.1 Reference Color Bar Pattern

The Reference Color Bar Patterns are based on the pattern defined in Appendix D of the mipi\_CTS\_for\_D-PHY\_v1-1\_r03 specification. The pattern is an eight color bar pattern designed to provide high, low, and medium frequency outputs on the CSI-2 transmit data lanes.

The CSI-2 Reference pattern provides eight color bars by default with the following byte data for the color bars: X bytes of 0xAA (high-frequency pattern, inverted) X bytes of 0x33 (mid-frequency pattern) X bytes of 0xF0

(low-frequency pattern, inverted) X bytes of 0x7F (lone 0 pattern) X bytes of 0x55 (high-frequency pattern) X bytes of 0xCC (mid-frequency pattern, inverted) X bytes of 0x0F (low-frequency pattern) Y bytes of 0x80 (lone 1 pattern) In most cases, Y will be the same as X. For certain data types, the last color bar may need to be larger than the others to properly fill the video line dimensions.

The Pattern Generator is programmable with the following options:

- Number of color bars (1, 2, 4, or 8)
- Number of bytes per line
- Number of bytes per color bar
- CSI-2 DataType field and VC-ID
- Number of active video lines per frame
- Number of total lines per frame (active plus blanking)
- Line period (possibly program in units of 10 ns)
- Vertical front porch number of blank lines prior to FrameEnd packet
- Vertical back porch number of blank lines following FrameStart packet

The pattern generator relies on proper programming by software to ensure the color bar widths are set to multiples of the block (or word) size required for the specified DataType. For example, for RGB888, the block size is 3 bytes which also matches the pixel size. In this case, the number of bytes per color bar must be a multiple of 3. The Pattern Generator is implemented in the CSI-2 Transmit clock domain, providing the pattern directly to the CSI-2 Transmitter. The circuit generates the CSI-2 formatted data.

### 7.5.11.2 Fixed Color Patterns

When programmed for Fixed Color Pattern mode, Pattern Generator can generate a video image with a programmable fixed data pattern. The basic programming fields for image dimensions are the same as used with the Color Bar Patterns. When sending Fixed Color Patterns, the color bar controls allow alternating between the fixed pattern data and the bit-wise inverse of the fixed pattern data.

The Fixed Color patterns assume a fixed block size for the byte pattern to be sent. The block size is programmable through the register and is designed to support most 8-bit, 10-bit, and 12-bit pixel formats. The block size should be set based on the pixel size converted to blocks that are an integer multiple of bytes. For example, an RGB888 pattern would consist of 3-byte pixels and therefore require a 3-byte block size. A 2x12-bit pixel image would also require 3-byte block size, while a 3x12-bit pixel image would require nine bytes (two pixels) to send an integer number of bytes. Sending a RAW10 pattern typically requires a 5-byte block size for four pixels, so 1x10-bit and 2x10-bit could both be sent with a 5-byte block size. For 3x10-bit, a 15-byte block size would be required.

The Fixed Color patterns support block sizes up to 16 bytes in length, allowing additional options for patterns in some conditions. For example, an RGB888 image could alternate between four different pixels by using a twelve-byte block size. An alternating black and white RGB888 image could be sent with a block size of 6-bytes and setting first three bytes to 0xFF and next three bytes to 0x00.

To support up to 16-byte block sizes, a set of sixteen registers are implemented to allow programming the value for each data byte. The line period is calculated in units of 10 ns, unless the CSI-2 mode is set to 400-Mb operation in which case the unit time dependancy is 20 ns.

# 7.5.11.3 Packet Generator Programming

The information in this section provides details on how to program the Pattern Generator to provide a specific color bar pattern, based on datatype, frame size, and line size.

Most basic configuration information is determined directly from the expected video frame parameters. The requirements should include the datatype, frame rate (frames per second), number of active lines per frame, number of total lines per frame (active plus blanking), and number of pixels per line.

- PGEN ACT LPF Number of active lines per frame
- PGEN TOT LPF Number of total lines per frame
- PGEN\_LSIZE Video line length size in bytes. Compute based on pixels per line multiplied by pixel size in bytes

#### www.ti.com

- CSI-2 DataType field and VC-ID
- Optional: PGEN\_VBP Vertical back porch. This is the number of lines of vertical blanking following Frame Valid
- Optional: PGEN\_VFP Vertical front porch. This is the number of lines of vertical blanking preceding Frame Valid
- PGEN LINE PD Line period in 10-ns units. Compute based on Frame Rate and total lines per frame
- PGEN\_BAR\_SIZE Color bar size in bytes. Compute based on datatype and line length in bytes (see details below)

### 7.5.11.3.1 Determining Color Bar Size

The color bar pattern should be programmed in units of a block or word size dependent on the datatype of the video being sent. The sizes are defined in the Mipi CSI-2 specification. For example, RGB888 requires a 3-byte block size which is the same as the pixel size. RAW10 requires a 5-byte block size which is equal to 4 pixels. RAW12 requires a 3-byte block size which is equal to 2 pixels.

When programming the Pattern Generator, software should compute the required bar size in bytes based on the line size and the number of bars. For the standard eight color bar pattern, that would require the following algorithm:

- Select the desired datatype, and a valid length for that datatype (in pixels).
- Convert pixels/line to blocks/line (by dividing by the number of pixels/block, as defined in the datatype specification).
- Divide the blocks/line result by the number of color bars (8), giving blocks/bar
- Round result down to the nearest integer
- · Convert blocks/bar to bytes/bar and program that value into the PGEN\_BAR\_SIZE register

As an alternative, the blocks/line can be computed by converting pixels/line to bytes/line and divide by bytes/block.

## 7.5.11.4 Code Example for Pattern Generator

```
#Patgen Fixed Colorbar 1280x720p30

```

### 7.5.12 FPD-Link BIST Mode

An optional At-Speed Built-In Self Test (BIST) feature supports testing of the high-speed serial link and the back channel without external data connections. The BIST mode is enabled by either applying a logic high level to the BISTEN pin or programming the BIST configuration register 0xB3. This is useful in the prototype stage, equipment production, in-system test, and system diagnostics.

When BIST is activated, the DS90UB936-Q1 sends register writes to the Serializer through the Back Channel. The control channel register writes configure the Serializer for BIST mode operation. The serializer outputs a continuous stream of a pseudo-random sequence and drives the link at speed. The deserializer detects the test pattern and monitors it for errors. The serializer also tracks errors indicated by the CRC fields in each back channel frame.

The LOCK, PASS and CMLOUT output functions are all available during BIST mode. While the lock indications are required to identify the beginning of proper data reception, for any link failures or data corruption, the best indication is the contents of the error counter in the BIST\_ERR\_COUNT register 0x57 for each RX port. The test may select whether the Serializer uses an external or internal clock as reference for the BIST pattern frequency.

## 7.5.12.1 BIST Operation Through BISTEN Pin

One method to enable BIST is by driving a logic high level on the BISTEN pin. During pin control BIST, the values on GPIO1 and GPIO0 pins will control whether the Serializer uses an external or internal clock for the BIST pattern. The values on GPIO1 and GPIO0 will be written to the Serializer register 0x14[2:1]. A value of 00 will select an external clock. A non-zero value will enable an internal clock of the frequency defined in the Serializer register 0x14. Note that when the DS90UB936-Q1 is paired with DS90UB933-Q1 or DS90UB913A-Q1, a setting of 11 may result in a frequency that is too slow for the DS90UB936-Q1 to recover. The GPIO1 and GPIO0 values are sampled at the start of BIST (when BISTEN pin transitions to high). Changing this value after BIST is enabled will not change operation. Link BIST can also be enabled by register control through the BIST Control register (address 0xB3)

## 7.5.12.2 BIST Operation Through Register Control

The FPD-Link III BIST is configured and enabled by programming the BIST Control register (address 0xB3). BIST pass or fail status may be brought to GPIO pins by selecting the Pass indication for each receive port using the GPIOx\_PIN\_CTL registers. The Pass/Fail status will be deasserted low for each data error detected on the selected port input data. In addition, it is advisable to bring the Receiver Lock status for selected ports to the GPIO pins as well. After completion of BIST, the BIST Error Counter may be read to determine if errors occurred during the test. If the DS90UB936-Q1 failed to lock to the input signal or lost lock to the input signal, the BIST Error Counter will indicate 0xFF. The maximum normal count value will be 0xFE. The SER\_BIST\_ACT register bit 0xD0[5] can be monitored during testing to ensure BIST is activated in the serializer.

During BIST, DS90UB936-Q1 output activity are gated by BIST\_Control[7:6] (BIST\_OUT\_MODE[1:0]). as follows:

00: Outputs disabled during BIST

10: Outputs enabled during BIST

When enabling the outputs by setting BIST\_OUT\_MODE = 10, the CSI-2 will be inactive by default (LP11 state). To exercise the CSI-2 interface during BIST mode, it is possible to Enable Pattern Generator to send a video data pattern on the CSI-2 outputs.

The BIST clock frequency is controlled by the BIST\_CLOCK\_SOURCE field in the BIST Control register. This 2-bit value will be written to the Serializer register 0x14[2:1]. A value of 00 will select an external clock. A non-zero value will enable an internal clock of the frequency defined in the Serializer register 0x14. Note that when the DS90UB936-Q1 is paired with DS90UB933-Q1or DS90UB913A-Q1, a setting of 11 may result in a frequency that is too slow for the DS90UB936-Q1 to recover. The BIST\_CLOCK\_SOURCE field is sampled at the start of BIST. Changing this value after BIST is enabled will not change operation.

## 7.6 Register Maps

In the register definitions under the TYPE and DEFAULT heading, the following definitions apply:

- R = Read only access
- R/W = Read / Write access
- · R/RC = Read only access, Read to Clear
- (R/W)/SC = Read / Write access, Self-Clearing bit
- (R/W)/S = Read / Write access, Set based on strap pin configuration at startup
- LL = Latched Low and held until read
- LH = Latched High and held until read
- S = Set based on strap pin configuration at startup

The DS90UB936-Q1 implements the following register blocks, accessible through I2C as well as the bidirectional control channel:

- Main Registers
- FPD-Link III RX Port Registers (separate register block for each of the four RX ports)
- CSI-2 Port Registers (separate register block for each of the CSI-2 ports)

**Table 7-18. Main Register Map Descriptions** 

ADDRESS RANG	GE DESCRIPTION	ADDRES	SS MAP		
0x00-0x31	Digital Shared Registers	Shared			
0x32-0x3A	Digital CSI-2 Tx Port Registers	Sha	red		
0x3B - 0x4B	Reserved	Rese	rved		
0x4C-0x7F Digital RX Port Registers (paged, broadcast write allowed)		FPD3 RX Port 0 R: 0x4C[5:4]=00 W: 0x4C[0]=1	FPD3 RX Port 1 R: 0x4C[5:4]=01 W: 0x4C[1]=1		
0x80-0xAF	Reserved	Reserved

0xF6-0xF7 0xFC-0xFF	Reserved	Rese	rved		

# 7.6.1 I2C Device ID Register

The I2C Device ID Register field always indicates the current value of the I2C ID. When bit 0 of this register is 0, this field is read-only and shows the strapped ID from device initialization after power on. When bit 0 of this register is 1, this field is read/write and can be used to assign any valid I2C ID address to the deserializer.

Table 7-19. I2C Device ID (Address 0x00)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:1	DEVICE_ID	R/W	0x3D	7-bit I2C ID of Deserializer.
0	DES_ID	R/W	0x0	Device ID is from strap     Register I2C Device ID overrides strapped value

# 7.6.2 Reset Register

The Reset register allows for soft digital reset of the DS90UB936-Q1 device internal circuitry without using PDB hardware analog reset. Digital Reset 0 is recommended if desired to reset without overwriting configuration registers to default values.

Table 7-20. Reset (Address 0x01)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:3	RESERVED	R/W	0x00	Reserved
2	RESTART _AUTOLOAD	(R/W)/SC	0x0	Restart Auto-load Setting this bit to 1 causes a re-load of the default settings including MODE and IDX. This bit is self-clearing. Software may check for Auto-load complete by checking the CFG_INIT_DONE bit in the DEVICE_STS register.
1	DIGITAL_RESET1	(R/W)/SC	0x0	Digital Reset 1 Resets the entire digital block including registers. This bit is self-clearing. 1: Reset 0: Normal operation
0	DIGITAL_RESET0	(R/W)/SC	0x0	Digital Reset 0 Resets the entire digital block except registers. This bit is self-clearing. 1: Reset 0: Normal operation

# 7.6.3 General Configuration Register

The general configuration register enables and disables high level block functionality.

**Table 7-21. General Configuration (Address 0x02)** 

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:6	RESERVED	R/W	0x0	Reserved
5	I2C_CONTROLLER _ENABLE	R/W	0x0	I2C Controller Enable. This bit must be set if system requires the deserializer to act as proxy controller for remote I2C access to the local I2C bus from remote serializers.  0: Block proxy Controller access to local I2C from remote serializers  1: Enable proxy Controller access to local I2C from remote serializers
4	OUTPUT_EN_MODE	R/W	0x1	Output Enable Mode. If set to 0, the CSI TX output port will be forced to the high-impedance state if no assigned RX ports have an active Receiver lock. If set to 1 and no assigned RX ports have an active Receiver lock the CSI TX output port will continue in normal operation and enter the LP-11 state. CSI TX operation will remain under register control via the CSI_CTL register for each port.
3	OUTPUT_ENABLE	R/W	0x1	Output Enable Control (usage dependant on Output Sleep State Select). If OUTPUT_SLEEP_STATE_SEL is set to 1 and OUTPUT_ENABLE is set to 0, the CSI TX outputs will be forced into a high impedance state.
2	OUTPUT_SLEEP _STATE _SELECT	R/W	0x1	OSS Select to control output state when LOCK is low (usage dependant on Output Enable) When OUTPUT_SLEEP _STATE _SELECT is set to 0, the CSI TX outputs will be forced into a HS-0 state.
1	RX_PARITY _CHECKER _ENABLE	R/W	0x1	FPD-Link III Parity Checker Enable 0: Disable 1: Enable
0	FORCE_REFCLK _DET	R/W	0x0	Force indication of external reference clock  0: Normal operation, reference clock detect circuit indicates the presence of an external reference clock  1: Force reference clock to be indicated present

## 7.6.4 Revision/Mask ID Register

Revision ID field for production silicon version can be read back from this register.

### Table 7-22. Revision/Mask ID (Address 0x03)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:4	REVISION_ID	R	0x2	Revision ID field
3:0	MASK_ID	R	0x0	Mask ID

# 7.6.5 DEVICE\_STS Register

Device status register provides read back access to high level link diagnostics.

### Table 7-23. DEVICE\_STS (Address 0x04)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7	CFG_CKSUM_STS	R	0x1	Configuration Checksum Passed. CFG_CKSUM_STS bit is set to one following initialization if the Configuration data had a valid checksum
6	CFG_INIT_DONE	R	0x1	Power-up initialization complete. CFG_INIT_DONE bit is set to one after Initialization is complete.
5	RESERVED	R	0x0	Reserved
4	REFCLK_VALID	R	0x0	REFCLK valid frequency bit indicates when a valid frequency has been detected on the REFCLK pin.  0: Invalid frequency detected  1: REFCLK frequency between 12MHz and 64MHz.
3	PASS	R	0x0	Device PASS status This bit indicates the PASS status for the device. The value in this register matches the indication on the PASS pin.
2	LOCK	R	0x0	Device LOCK status This bit indicates the LOCK status for the device. The value in this register matches the indication on the LOCK pin.
1:0	RESERVED	R	0x3	Reserved

## 7.6.6 PAR\_ERR\_THOLD\_HI Register

For each port, if the FPD-Link III receiver detects a number of parity errors greater than or equal to total value in PAR\_ERR\_THOLD[15:0], the PARITY\_ERROR flag is set in the RX\_PORT\_STS1 register. PAR ERR THOLD HI contains bits [15:8] of the 16 bit parity error threshold PAR ERR THOLD[15:0].

## Table 7-24. PAR\_ERR\_THOLD\_HI (Address 0x05)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	PAR_ERR_THOLD _HI	R/W	0x01	FPD3 Parity Error Threshold High byte This register provides the 8 most significant bits [15:8] of the Parity Error Threshold value PAR_ERR_THOLD[15:0].

## 7.6.7 PAR\_ERR\_THOLD\_LO Register

For each port, if the FPD-Link III receiver detects a number of parity errors greater than or equal to total value in PAR\_ERR\_THOLD[15:0], the PARITY\_ERROR flag is set in the RX\_PORT\_STS1 register. PAR\_ERR\_THOLD\_LO contains bits [7:0] of the 16 bit parity error threshold PAR\_ERR\_THOLD[15:0].

### Table 7-25. PAR ERR THOLD LO (Address 0x06)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	PAR_ERR_THOLD _LO	R/W	0x0	FPD3 Parity Error Threshold Low byte This register provides the 8 least significant bits [7:0] of the Parity Error Threshold value PAR_ERR_THOLD[15:0].

# 7.6.8 BCC Watchdog Control Register

The BCC watchdog timer allows termination of a control channel transaction if it fails to complete within a programmed amount of time.

Table 7-26. BCC Watchdog Control (Address 0x07)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:1	BCC_WATCHDOG _TIMER	R/W	0x7F	Sets the Bidirectional Control Channel Watchdog Timeout value in units of 2 milliseconds. This field should not be set to 0.
0	BCC_WATCHDOG _TIMER_DISABLE	R/W	0x0	Disable Bidirectional Control Channel Watchdog Timer  1: Disables BCC Watchdog Timer operation  0: Enables BCC Watchdog Timer operation

# 7.6.9 I2C Control 1 Register

## Table 7-27. I2C Control 1 (Address 0x08)

	Table 1 211 120 Control 1 (Madicoc Choo)					
BIT	FIELD	TYPE	DEFAULT	DESCRIPTION		
7	LOCAL_WRITE _DISABLE	R/W	0x0	Disable Remote Writes to Local Registers Setting this bit to a 1 will prevent remote writes to local device registers from across the control channel. This prevents writes to the Deserializer registers from an I2C controller attached to the Serializer. Setting this bit does not affect remote access to I2C targets at the Deserializer.		
6:4	I2C_SDA_HOLD	R/W	0x1	Internal SDA Hold Time This field configures the amount of internal hold time provided for the SDA input relative to the SCL input. Units are 40 nanoseconds.		
3:0	I2C_FILTER_DEPTH	R/W	0xC	I2C Glitch Filter Depth This field configures the maximum width of glitch pulses on the SCL and SDA inputs that will be rejected. Units are 5 nanoseconds.		

# 7.6.10 I2C Control 2 Register

### Table 7-28. I2C Control 2 (Address 0x09)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:4	SDA_OUTPUT_SET UP	R/W	0x1	Remote Ack SDA Output Setup When a Control Channel (remote) access is active, this field configures setup time from the SDA output relative to the rising edge of SCL during ACK cycles. Setting this value will increase setup time in units of 640ns. The nominal output setup time value for SDA to SCL are: 00:80ns 01:720ns 10:1400ns 11:2080ns
3:2	SDA_OUTPUT_DEL AY	R/W	0x0	SDA Output Delay This field configures additional delay on the SDA output relative to the falling edge of SCL. Setting this value increases output delay in units of 40ns. Nominal output delay values for SCL to SDA are: 00 : 240ns 01: 280ns 10: 320ns 11: 360ns
1	I2C_BUS_TIMER _SPEEDUP	R/W	0x0	Speed up I2C Bus Watchdog Timer  1: Watchdog Timer expires after approximately 50 microseconds  0: Watchdog Timer expires after approximately 1 second.

Table 7-28. I2C Control 2 (Address 0x09) (continued)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
0	I2C_BUS_TIMER _DISABLE	R/W	0x0	Disable I2C Bus Watchdog Timer When enabled, the I2C Watchdog Timer may be used to detect when the I2C bus is free or hung up following an invalid termination of a transaction. If SDA is high and no signalling occurs for approximately 1 second, the I2C bus is assumed to be free. If SDA is low and no signaling occurs, the device will attempt to clear the bus by driving 9 clocks on SCL

#### 7.6.11 SCL High Time Register

The SCL High Time register field configures the high pulse width of the I2C SCL output when the Serializer is the Controller on the local I2C bus. Units are 40 ns for the nominal oscillator clock frequency. The default value is set to approximately 100 kHz with the internal oscillator clock running at nominal 25 MHz. Delay includes 4 additional oscillator clock periods. The internal oscillator has ±10% variation when REFCLK is not applied, which must be taken into account when setting the SCL High and Low Time registers.

Table 7-29. SCL High Time (Address 0x0A)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	SCL_HIGH_TIME	R/W	0x7A	I2C Controller SCL high time Default set to approximately 100 kHz when REFCLK = 25 MHz. Nominal High Time = 40 ns × (SCL HIGH TIME + 4)

### 7.6.12 SCL Low Time Register

The SCL Low Time register field configures the low pulse width of the SCL output when the serializer is the controller on the local I2C bus. This value is also used as the SDA setup time by the I2C Target for providing data prior to releasing SCL during accesses over the Bidirectional control channel. Units are 40 ns for the nominal oscillator clock frequency. The default value is set to approximately 100 kHz with the internal oscillator clock running at nominal 25 MHz. Delay includes 4 additional oscillator clock periods. The internal oscillator has ±10% variation when REFCLK is not applied, which must be taken into account when setting the SCL High and Low Time registers.

Table 7-30. SCL Low Time (Address 0x0B)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	SCL_LOW_TIME	R/W	0x7A	I2C SCL low time Default set to approximately 100 kHz when REFCLK = 25 MHz. Nominal low time = 40 ns × (SCL LOW TIME + 4)

#### 7.6.13 RX PORT CTL Register

Receiver port control register assigns rules for lock and pass in the general status register and allows for enabling and disabling each Rx port.

Table 7-31. RX\_PORT\_CTL (Address 0x0C)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:6	RESERVED	R	0x2	Reserved
5:4	PASS_SEL	R/W	0x00	Pass Output Select Both receivers can be active at the same time. This field controls the source of the PASS output. 00: Port 0 Receiver Pass 01: Port 1 Receiver Pass 10: Any Enabled Receiver Port Pass 11: All Enabled Receiver Ports Pass This field can only be written via a local I2C controller.
3:2	LOCK_SEL	R/W	0x0	Lock Output Select Both receivers can be active at the same time. This field controls the source of the LOCK output. 00: Port 0 Receiver Lock 01: Port 1 Receiver Lock 10: Any Enabled Receiver Port Lock 11: All Enabled Receiver Ports Lock. This field can only be written via a local I2C controller.
1	PORT1_EN	R/W	0x1	Port 1 Receiver Enable 0: Disable Port 1 Receiver 1: Enable Port 1 Receiver
0	PORT0_EN	R/W	0x1	Port 0 Receiver Enable 0: Disable Port 0 Receiver 1: Enable Port 0 Receiver

# 7.6.14 IO\_CTL Register

# Table 7-32. IO\_CTL (Address 0x0D)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7	SEL3P3V	R/W	0x0	3.3V I/O Select on I2C_SCL, I2C_SDA and INTB pins. 0: 1.8V I/O Supply 1: 3.3V I/O Supply If IO_SUPPLY_MODE_OV is 0, a read of this register will return the detected I/O voltage level.
6	IO_SUPPLY _MODE_OV	R/W	0x0	Override I/O Supply Mode bit 0: Detected I/O voltage level will be used for both SEL3P3V and IO_SUPPLY_MODE controls. 1: Register values written to the SEL3P3V and IO_SUPPLY_MODE fields will be used.
5:4	IO_SUPPLY_MODE	R/W	0x0	I/O Supply Mode 00: 1.8V 01: Reserved 10: Reserved 11: 3.3V If IO_SUPPLY_MODE_OV is 0, a read of this register will return the detected I/O voltage level.
3:0	RESERVED	R/W	0x9	Reserved

# 7.6.15 GPIO\_PIN\_STS Register

This register reads the current values on each of the 7 GPIO pins.

# Table 7-33. GPIO\_PIN\_STS (Address 0x0E)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7	RESERVED	R	0x0	Reserved
6:0	GPIO_STS	R	(1)(1)	GPIO Pin High/ Low Status. Bit 6 reads GPIO6 and bit 0 reads GPIO0.

# 7.6.16 GPIO\_INPUT\_CTL Register

# Table 7-34. GPIO\_INPUT\_CTL (Address 0x0F)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7	RESERVED	R	0x0	Reserved
6	GPIO6_INPUT_EN	R/W	0x1	GPIO6 Input Enable. Must be set to zero if GPIO6 is configured as an output by setting 0x16[0] = 1 0: Disabled 1: Enabled
5	GPIO5_INPUT_EN	R/W	0x1	GPIO5 Input Enable. Must be set to zero if GPIO5 is configured as an output by setting 0x15[0] = 1 0: Disabled 1: Enabled
4	GPIO4_INPUT_EN	R/W	0x1	GPIO4 Input Enable. Must be set to zero if GPIO4 is configured as an output by setting 0x14[0] = 1 0: Disabled 1: Enabled
3	GPIO3_INPUT_EN	R/W	0x1	GPIO3 Input Enable. Must be set to zero if GPIO3 is configured as an output by setting 0x13[0] = 1 0: Disabled 1: Enabled

4:2	GPI05_OUT_SRC	R/W	0x0	GPIO5 Output Source Select Selects output source for GPIO5 data: See Table 7-8.
1	GPIO5_OUT_VAL	R/W	0x0	GPIO5 Output Value This register provides the output data value when the GPIO pin is enabled to output the local register controlled value by setting GPIO5_OUT_SRC[2:0] = 100 and GPIO5_OUT_SEL[2:0] = 00
0	GPIO5_OUT_EN	R/W	0x0	GPIO5 Output Enable. Must be set to zero when configured as an input in GPIO Input Control register, 0x0F[5] = 1. 0: Disabled 1: Enabled

### 7.6.23 GPIO6\_PIN\_CTL Register

# Table 7-41. GPIO6\_PIN\_CTL (Address 0x16)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:5	GPIO6_OUT_SEL	R/W	0x0	GPIO6 Output Select Determines the output data for the selected source. See Section 7.4.13.2.
4:2	GPIO6_OUT_SRC	R/W	0x0	GPIO6 Output Source Select Selects output source for GPIO6 data: See Table 7-8
1	GPIO6_OUT_VAL	R/W	0x0	GPIO6 Output Value This register provides the output data value when the GPIO pin is enabled to output the local register controlled value by setting GPIO6_OUT_SRC[2:0] = 100 and GPIO6_OUT_SEL[2:0] = 00
0	GPIO6_OUT_EN	R/W	0x0	GPIO6 Output Enable. Must be set to zero when configured as an input in GPIO Input Control register, 0x0F[6] = 1. 0: Disabled 1: Enabled

# 7.6.24 RESERVED Register

# Table 7-42. RESERVED (Address 0x17)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	RESERVED	R	0x0	Reserved.

# 7.6.25 FS\_CTL Register

# Table 7-43. FS\_CTL (Address 0x18)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:4	FS_MODE	R/W	0×0	FrameSync Mode 0000: Internal Generated FrameSync, use back channel frame clock from port 0 0001: Internal Generated FrameSync, use back channel frame clock from port 1 0010: Reserved. 0011: Reserved 01xx: Internal Generated FrameSync, use 25MHz clock 1000: External FrameSync from GPIO0 1001: External FrameSync from GPIO1 1010: External FrameSync from GPIO2 1011: External FrameSync from GPIO3 1100: External FrameSync from GPIO4 1101: External FrameSync from GPIO5 1110: External FrameSync from GPIO6 1111: Reserved
3	FS_SINGLE	(R/W)/SC	0x0	Generate Single FrameSync pulse When this bit is set, a single FrameSync pulse will be generated. The system should wait for the full duration of the desired pulse before generating another pulse. When using this feature, the FS_GEN_ENABLE bit should remain set to 0. This bit is self-clearing and will always return 0.
2	FS_INIT_STATE	R/W	0x0	Initial State. This register controls the initial state of the FrameSync signal.  0: FrameSync initial state is 0  1: FrameSync initial state is 1
1	FS_GEN_MODE	R/W	0x0	FrameSync Generation Mode This control selects between Hi/Lo and 50/50 modes. In Hi/Lo mode, the FrameSync generator uses the FS_HIGH_TIME [15:0] and FS_LOW_TIME [15:0] register values to separately control the High and Low periods for the generated FrameSync signal. In 50/50 mode, the FrameSync generator uses the values in the FS_HIGH_TIME_0, FS_LOW_TIME_1 and FS_LOW_TIME_0 registers as a 24-bit value for both the High and Low periods of the generated FrameSync signal. 0: Hi/Lo 1: 50/50
0	FS_GEN_ENABLE	R/W	0x0	FrameSync Generation Enable 0: Disabled 1: Enabled

# 7.6.26 FS\_HIGH\_TIME\_1 Register

# Table 7-44. FS\_HIGH\_TIME\_1 (Address 0x19)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	FRAMESYNC_HIGH_ TIME_1	R/W	0x0	FrameSync High Time bits 15:8 The value programmed to the FS_HIGH_TIME register should be reduced by 1 from the desired delay. For example, a value of 0 in the FRAMESYNC_HIGH_TIME field will result in a 1 cycle high pulse on the FrameSync signal.

# 7.6.27 FS\_HIGH\_TIME\_0 Register

### Table 7-45. FS\_HIGH\_TIME\_0 (Address 0x1A)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	FRAMESYNC _HIGH_TIME_0	R/W	0x0	FrameSync High Time bits 7:0 The value programmed to the FS_HIGH_TIME register should be reduced by 1 from the desired delay. For example, a value of 0 in the FRAMESYNC_HIGH_TIME field will result in a 1 cycle high pulse on the FrameSync signal.

### 7.6.28 FS\_LOW\_TIME\_1 Register

## Table 7-46. FS\_LOW\_TIME\_1 (Address 0x1B)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	FRAMESYNC _LOW_TIME_1	R/W		FrameSync Low Time bits 15:8 The value programmed to the FS_LO_TIME register should be reduced by 1 from the desired delay. For example, a value of 0 in the FRAMESYNC_LO_TIME field will result in a 1 cycle high pulse on the FrameSync signal.

### 7.6.29 FS\_LOW\_TIME\_0 Register

## Table 7-47. FS\_LOW\_TIME\_0 (Address 0x1C)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	FRAMESYNC_LOW_ TIME_0	R/W	0x0	FrameSync Low Time bits 7:0 The value programmed to the FS_LO_TIME register should be reduced by 1 from the desired delay. For example, a value of 0 in the FRAMESYNC_LO_TIME field will result in a 1 cycle high pulse on the FrameSync signal.

#### 7.6.30 MAX\_FRM\_HI Register

#### Table 7-48. MAX\_FRM\_HI (Address 0x1D)

_					_ '
	BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
	7:0	MAX_FRAME_HI	R/W	0x00	CSI-2 Maximum Frame Count bits 15:8 In RAW mode operation, the FPD3 Receiver will create CSI-2 video frames. For the Frame Start and Frame End packets of each video frame, a 16-bit frame number field will be generated. If the Maximum Frame Count value is set to 0, the frame number is disabled and will always be 0. If Maximum Frame Count value is non-zero, the frame number will increment for each from 1 up to the Maximum Frame Count value before resetting to 1.

### 7.6.31 MAX\_FRM\_LO Register

### Table 7-49. MAX FRM LO (Address 0x1E)

		10010 7 10		
BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	MAX_FRAME_LO	R/W	0x04	CSI-2 Maximum Frame Count bits 7:0 In RAW mode operation, the FPD3 Receiver will create CSI-2 video frames. For the Frame Start and Frame End packets of each video frame, a 16-bit frame number field will be generated. If the Maximum Frame Count value is set to 0, the frame number is disabled and will always be 0. If Maximum Frame Count value is non-zero, the frame number will increment for each from 1 up to the Maximum Frame Count value before resetting to 1.

		100 011 ) (00 111 ) (00 111 ) (00 111 ) (00 111 ) (00 111 ) (00 111 ) (00 111 )		
BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
3:2	RESERVED	R/W	0x0	Reserved
1:0	CSI_TX_SPEED	R/W	0x2	CSI Transmitter Speed select: Controls the CSI Transmitter frequency. 00 : 1.6 Gbps serial rate 01 : Reserved 10 : 800 Mbps serial rate 11 : 400 Mbps serial rate

# 7.6.33 FWD\_CTL1 Register

Forwarding control enables or disables video stream from each Rx Port.

## Table 7-51. FWD CTL1 (Address 0x20)

	(								
BIT	FIELD	TYPE	DEFAULT	DESCRIPTION					
7:6	RESERVED	R/W	0x0	Reserved.					
5	FWD_PORT1_DIS	R/W	0x1	Disable forwarding of RX Port 1 0: Forwarding enabled for RX Port 1 1: Forwarding disabled for RX Port 1					
4	FWD_PORT0_DIS	R/W	0x1	Disable forwarding of RX Port 0 0: Forwarding enabled for RX Port 0 1: Forwarding disabled for RX Port 0					
3:0	RESERVED	R	0x0	Reserved.					

# 7.6.34 FWD\_CTL2 Register

# Table 7-52. FWD\_CTL2 (Address 0x21)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7	CSI_REPLICATE	R/W	0x0	CSI Replicate Mode. When set to a 1, the CSI output from port 0 will also be generated on CSI port 1. In this mode, each CSI port may be one or two lanes only. The same output data will be presented on both ports.
6	FWD_SYNC _AS_AVAIL	R/W	0x0	Synchronized Forwarding. As Available During Synchronized Forwarding, each forwarding engine will wait for video data to be available from each enabled port, prior to sending the video line. Setting this bit to a 1 will allow sending the next video line as it becomes available. For example if RX Ports 0 and 1 are being forwarded, port 0 video line is forwarded when it becomes available, rather than waiting until both ports 0 and ports 1 have video data available. This operation may reduce the likelihood of buffer overflow errors in some conditions. This bit will have no effect in video line concatenation mode and only affects video lines (long packets) rather than synchronization packets. (See Section 7.4.28.3.)
5:4	RESERVED	R	0x0	Reserved.
3:2	CSI0_SYNC_FWD	R/W	0x00	Enable synchronized forwarding for CSI output port 0. (See Section 7.4.28.3.)  00: Synchronized forwarding disabled  01: Basic Synchronized forwarding enabled  10: Synchronous forwarding with line interleaving  11: Synchronous forwarding with line concatenation  Only one of CSI0_RR_FWD and CSI0_SYNC_FWD must be set at a time.
1	RESERVED	R/W	0x0	Reserved.

# Table 7-52. FWD\_CTL2 (Address 0x21) (continued)

				(* 144.1000 07.2 1) (00114.14.04.)
BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
0	CSI0_RR_FWD	R/W	0x1	Enable round robin forwarding for CSI TX output port. When this mode is enabled, no attempt is made to synchronize the video traffic. When multiple sources have data available to forward, the data will tend to be forwarded in a round-robin fashion.  0: Round robin forwarding disabled  1: Round robin forwarding enabled  Only one of CSI0_RR_FWD and CSI0_SYNC_FWD must be set at a time.

# 7.6.35 FWD\_STS Register

### Table 7-53. FWD\_STS (Address 0x22)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:3	RESERVED	R	0x0	Reserved
2	FWD_SYNC_FAIL0	R/RC	0x0	Forwarding synchronization failed for CSI TX output port During Synchronized forwarding, this flag indicates a failure of synchronized video has been detected. For this bit to be set, the forwarding process must have previously been successful at sending at least one synchronized video frame.  0: No failure 1: Synchronization failure This bit is cleared on read.
1	RESERVED	R	0x0	Reserved
0	FWD_SYNC0	R	0x0	Forwarding synchronized for CSI TX output port: During Synchronized forwarding, this bit indicates that the forwarding engine is currently able to provide synchronized video from enabled Receive ports. This bit is always 0 if Synchronized forwarding is disabled.  0: Not synchronized  1: Synchronized

# 7.6.36 INTERRUPT\_CTL Register

## Table 7-54. INTERRUPT\_CTL (Address 0x23)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7	INT_EN	R/W	0x0	Global Interrupt Enable: Enables interrupt on the interrupt signal to the controller.
6:5	RESERVED	R	0x0	Reserved
4	IE_CSI_TX0	R/W	0x0	CSI Transmit Port Interrupt: Enable interrupt from CSI Transmitter Port.
3:2	RESERVED	R	0x0	Reserved
1	IE_RX1	R/W	0x0	RX Port 1 Interrupt: Enable interrupt from Receiver Port 1.
0	IE_RX0	R/W	0x0	RX Port 0 Interrupt: Enable interrupt from Receiver Port 0.

# 7.6.37 INTERRUPT\_STS Register

# Table 7-55. INTERRUPT\_STS (Address 0x24)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7	INTERRUPT_STS	R	0x0	Global Interrupt: Set if any enabled interrupt is indicated in the individual status bits in this register. The setting of this bit is not dependent on the INT_EN bit in the INTERRUPT_CTL register but does depend on the IE_xxx bits. For example, if IE_RX0 and IS_RX0 are both asserted, the INTERRUPT_STS bit is set to 1.
6:5	RESERVED	R	0x0	Reserved
4	IS_CSI_TX0	R	0x0	CSI Transmit Port Interrupt: An interrupt has occurred for CSI Transmitter Port 0. This interrupt is cleared upon reading the CSI_TX_ISR register for CSI Transmit Port.
3:2	RESERVED	R	0x0	Reserved
1	IS_RX1	R	0x0	RX Port 1 Interrupt: An interrupt has occurred for Receive Port 1. This interrupt is cleared by reading the associated status register(s) for the event(s) that caused the interrupt. The status registers are RX_PORT_STS1, RX_PORT_STS2, and CSI_RX_STS.
0	IS_RX0	R	0x0	RX Port 0 Interrupt: An interrupt has occurred for Receive Port 0. This interrupt is cleared by reading the associated status register(s) for the event(s) that caused the interrupt. The status registers are RX_PORT_STS1, RX_PORT_STS2, and CSI_RX_STS.

# 7.6.38 TS\_CONFIG Register

## Table 7-56. TS\_CONFIG (Address 0x25)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7	RESERVED	R	0x0	Reserved
6	FS_POLARITY	R/W	0x0	Framesync Polarity Indicates active edge of FrameSync signal 0: Rising edge 1: Falling edge
5:4	TS_RES_CTL	R/W	0x0	Timestamp Resolution Control. For typical applications of 30-Hz and 60-Hz frame rate 1.0- $\mu$ s setting 11 = 1.0 $\mu$ s should be selected to give counter duration of 1.0 $\mu$ s × 65535 = 65.5 ms 00: 40 ns 01: 80 ns 10: 160 ns 11: 1.0 $\mu$ s
3	TS_AS_AVAIL	R/W	0x0	Timestamp Ready Control 0: Normal operation 1: Indicate timestamps ready as soon as all port timestamps are available
2	RESERVED	R	0x0	Reserved
1	TS_FREERUN	R/W	0x0	FreeRun Mode 0: FrameSync mode 1: FreeRun mode
0	TS_MODE	R/W	0x0	Timestamp Mode 0: Line start 1: Frame start

### 7.6.39 TS\_CONTROL Register

# Table 7-57. TS\_CONTROL (Address 0x26)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:5	RESERVED	R	0x0	Reserved
4	TS_FREEZE	R/W	0x0	Freeze Timestamps 0: Normal operation 1: Freeze timestamps Setting this bit freezes timestamps and clears the TS_READY flag. The TS_FREEZE bit should be cleared after reading timestamps to resume operation.
3:2	RESERVED	R	0x0	Reserved
1	TS_ENABLE1	R/W	0x0	Timestamp Enable RX Port 1 0: Disabled 1: Enabled
0	TS_ENABLE0	R/W	0x0	Timestamp Enable RX Port 0 0: Disabled 1: Enabled

# 7.6.40 TS\_LINE\_HI Register

## Table 7-58. TS\_LINE\_HI (Address 0x27)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	TS_LINE_HI	R/W	0x0	Timestamp Line, upper 8 bits This field is the line number at which to capture the timestamp when Line Start mode is enabled. For proper operation, the line number should be set to a value greater than 1. During Frame Start mode, if TS_FREERUN is set, the TS_LINE value is used to determine when to begin checking for Frame Start

# 7.6.41 TS\_LINE\_LO Register

# Table 7-59. TS\_LINE\_LO (Address 0x28)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	TS_LINE_LO	R/W	0x0	Timestamp Line, lower 8 bits This field is the line number at which to capture the timestamp when Line Start mode is enabled. For proper operation, the line number should be set to a value greater than 1. During Frame Start mode, if TS_FREERUN is set, the TS_LINE value is used to determine when to begin checking for Frame Start

### 7.6.42 TS\_STATUS Register

### Table 7-60. TS\_STATUS (Address 0x29)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:5	RESERVED	R	0x0	Reserved
4	TS_READY	R	0x0	Timestamp Ready This flag indicates when timestamps are ready to be read. This flag is cleared when the TS_FREEZE bit is set.
3:2	RESERVED	R	0x0	Reserved
1	TS_VALID1	R	0x0	Timestamp Valid, RX Port 1
0	TS_VALID0	R	0x0	Timestamp Valid, RX Port 0

## 7.6.43 TIMESTAMP\_P0\_HI Register

### Table 7-61. TIMESTAMP\_P0\_HI (Address 0x2A)

# 7.6.48 CSI\_CTL Register

# Table 7-66. CSI\_CTL (Address 0x33)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7	RESERVED	R	0x0	Reserved
6	CSI_CAL_EN	R/W	0x0	Enable initial CSI Skew-Calibration sequence When the initial skew-calibration sequence is enabled, the CSI Transmitter will send the sequence at initialization, prior to sending any HS data. This bit should be set when operating at 1.6 Gbps CSI speed (as configured in the CSI_PLL_CTL register).  0: Disabled 1: Enabled
5:4	CSI_LANE_COUNT	R/W	0x0	CSI lane count 00: 4 lanes 01: 3 lanes 10: 2 lanes 11: 1 lane If CSI_REPLICATE is set in the FWD_CTL2 register, the device must be programmed for 1 or 2 lanes only.
3:2	CSI_ULP	R/W	0x0	Force LP00 state on data/clock lanes 00: Normal operation 01: LP00 state forced only on data lanes 10: Reserved 11: LP00 state forced on data and clock lanes
1	CSI_CONTS _CLOCK	R/W	0x0	Enable CSI continuous clock mode. CSI-2 Tx outputs will provide a continuous clock output signal once first packet is received.  0: Disabled  1: Enabled
0	CSI_ENABLE	R/W	0x0	Enable CSI output 0: Disabled 1: Enabled

# 7.6.49 CSI\_CTL2 Register

# Table 7-67. CSI\_CTL2 (Address 0x34)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:4	RESERVED	R	0x4	Reserved
3	CSI_PASS_MODE	R/W	0x0	CSI PASS indication mode Determines whether the CSI Pass indication is for a single port or all enabled ports. 0 : Assert PASS if at least one enabled Receive port is providing valid video data 1 : Assert PASS only if ALL enabled Receive ports are providing valid video data
2	CSI_CAL_INV	R/W	0x0	CSI Calibration Inverted Data pattern During the CSI skew-calibration pattern, the CSI Transmitter will send a sequence of 01010101 data (first bit 0). Setting this bit to a 1 will invert the sequence to 10101010 data.
1	CSI_CAL _SINGLE	(R/W)/SC	0x0	Enable single periodic CSI Skew-Calibration sequence Setting this bit will send a single skew-calibration sequence from the CSI Transmitter. The skew-calibration sequence is the 1010 bit sequence required for periodic calibration. The calibration sequence is sent at the next idle period on the CSI interface. This bit is self-clearing and will reset to 0 after the calibration sequence is sent.
0	CSI_CAL _PERIODIC	R/W	0x0	Enable periodic CSI Skew-Calibration sequence When the periodic skew-calibration sequence is enabled, the CSI Transmitter will send the periodic skew-calibration sequence following the sending of Frame End packets. 0: Disabled 1: Enabled

# 7.6.50 CSI\_STS Register

# Table 7-68. CSI\_STS (Address 0x35)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:2	RESERVED	R	0x0	Reserved
1	TX_PORT_SYNC	R	0x0	TX Port Synchronized This bit indicates the CSI Transmit Port is able to properly synchronize input data streams from multiple sources. This bit is 0 if synchronization is disabled via the FWD_CTL2 register.  0 : Input streams are not synchronized 1 : Input streams are synchronized
0	TX_PORT_PASS	R	0x0	TX Port Pass Indicates valid data is available on at least one port, or on all ports if configured for all port status via the CSI_PASS_MODE bit in the CSI_CTL2 register. The function differs based on mode of operation. In non-synchronous operation, the TX_PORT_PASS indicates the CSI port is actively delivering valid video data. The status is cleared based on detection of an error condition that interrupts transmission. During Synchronized forwarding, the TX_PORT_PASS indicates valid data is available for delivery on the CSI TX output. Data may not be delivered if ports are not synchronized. The TX_PORT_SYNC status is a better indicator that valid data is being delivered to the CSI transmit port.

# 7.6.51 CSI\_TX\_ICR Register

### Table 7-69. CSI\_TX\_ICR (Address 0x36)

Tuble 1 ob. obi_TX_Tolk (Address exce)					
BIT	FIELD	TYPE	DEFAULT	DESCRIPTION	
7:5	RESERVED	R	0x0	Reserved	
4	IE_RX_PORT_INT	R/W	0x0	RX Port Interrupt Enable Enable interrupt based on receiver port interrupt for the RX Ports being forwarded to the CSI Transmit Port.	
3	IE_CSI_SYNC _ERROR	R/W	0x0	CSI Sync Error interrupt Enable Enable interrupt on CSI Synchronization enable.	
2	IE_CSI_SYNC	R/W	0x0	CSI Synchronized interrupt Enable Enable interrupts on CSI Transmit Port assertion of CSI Synchronized Status.	
1	IE_CSI_PASS _ERROR	R/W	0x0	CSI RX Pass Error interrupt Enable Enable interrupt on CSI Pass Error	
0	IE_CSI_PASS	R/W	0x0	CSI Pass interrupt Enable Enable interrupt on CSI Transmit Port assertion of CSI Pass.	

88

### 7.6.52 CSI\_TX\_ISR Register

## Table 7-70. CSI\_TX\_ISR (Address 0x37)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:5	RESERVED	R	0x0	Reserved
4	IS_RX_PORT_INT	R	0x0	RX Port Interrupt A Receiver port interrupt has been generated for one of the RX Ports being forwarded to the CSI Transmit Port. A read of the associated port receive status registers will clear this interrupt. See the PORT_ISR_HI and PORT_ISR_LO registers for details.
3	IS_CSI_SYNC_ERR OR	R/RC	0x0	CSI Sync Error interrupt A synchronization error has been detected for multiple video stream inputs to the CSI Transmitter.
2	IS_CSI_SYNC	R/RC	0x0	CSI Synchronized interrupt CSI Transmit Port assertion of CSI Synchronized Status. Current status for CSI Sync can be read from the TX_PORT_SYNC flag in the CSI_STS register.
1	IS_CSI_PASS_ERR OR	R/RC	0x0	CSI RX Pass Error interrupt A deassertion of CSI Pass has been detected on one of the RX Ports being forwarded to the CSI Transmit Port
0	IS_CSI_PASS	R/RC	0x0	CSI Pass interrupt CSI Transmit Port assertion of CSI Pass detected. Current status for the CSI Pass indication can be read from the TX_PORT_PASS flag in the CSI_STS register

# 7.6.62 SFILTER\_CFG Register

The SFilter configuration register controls the minimum and maximum values allow for the clock to data sample timing. It is recommended to program this register to 0xA9 during initialization for optimal startup time and ensure consistent AEQ performance across different channel characteristics.

Table 7-80. SFILTER\_CFG (Address 0x41)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:4	SFILTER_MAX	R/W	0xA	SFILTER maximum setting This field controls the maximum SFILTER setting. Allowed values are 0-14 with 7 being the mid point. These values are used for both AEQ adaption and dynamic SFILTER control. The maximum setting must be greater than or equal to the minimum setting.
3:0	SFILTER_MIN	R/W	0x7	SFILTER minimum setting. This field controls the maximum SFILTER setting. Allowed values are 0-14, where 7 is the mid point. These values are used for both AEQ adaption and dynamic SFILTER control. The minimum setting must be less than or equal to the SFILTER_MAX. Recommend to set SFILTER_MIN = 0x9 for normal operation in typical system use cases.

### 7.6.63 AEQ\_CTL1 Register

## Table 7-81. AEQ\_CTL1 (Address 0x42)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7	RESERVED	R	0x0	Reserved
6:4	AEQ_ERR_CTL	R/W	0x7	AEQ Error Control Setting any bits in AEQ_ERR_CTL will enable FPD3 error checking during the Adaptive Equalization process. Errors are accumulated over 1/2 of the period of the timer set by the ADAPTIVE_EQ_RELOCK_TIME filed in the AEQ_CTL2 register. If the number of errors is greater than the programmed threshold (AEQ_ERR_THOLD), the AEQ will attempt to increase the EQ setting. The errors may also be checked as part of EQ setting validation if AEQ_2STEP_EN is set. The following errors are checked based on this three bit field: [6] FPD-Link III clock errors [5] Packet encoding errors [4] Parity errors
3	RESERVED	R/W	0x0	Reserved
2	AEQ_2STEP_EN	R/W	0x0	AEQ 2-step enable This bit enables a two-step operation as part of the Adaptive EQ algorithm. If disabled, the state machine will wait for a programmed period of time, then check status to determine if setting is valid. If enabled, the state machine will wait for 1/2 the programmed period, then check for errors over an additional 1/2 the programmed period. If errors occur during the 2nd step, the state machine will immediately move to the next setting.  0: Wait for full programmed delay, then check instantaneous lock value 1: Wait for 1/2 programmed time, then check for errors over 1/2 programmed time. The programmed time is controlled by the ADAPTIVE_EQ_RELOCK_TIME field in the AEQ_CTL2 register
1	AEQ_OUTER_LOOP	R/W	0x0	AEQ outer loop control This bit controls whether the Equalizer or SFILTER adaption is the outer loop when the AEQ adaption includes SFILTER adaption. 0 : AEQ is inner loop, SFILTER is outer loop 1 : AEQ is outer loop, SFILTER is inner loop
0	AEQ_SFILTER_EN	R/W	0x1	Enable SFILTER Adaption with AEQ Setting this bit allows SFILTER adaption as part of the Adaptive Equalizer algorithm.

### 7.6.64 AEQ\_ERR\_THOLD Register

#### Table 7-82. AEQ ERR THOLD (Address 0x43)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	AEQ_ERR _THRESHOLD	R/W	0x1	AEQ Error Threshold This register controls the error threshold to determine when to re-adapt the EQ settings. This register should not be programmed to a value of 0.

#### 7.6.65 RESERVED Register

#### Table 7-83. RESERVED (Address 0x44 – 0x49)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	RESERVED	R	0x00	Reserved

#### 7.6.66 FPD3\_CAP Register

RX port specific register. The FPD-Link III Port Select register 0x4C configures which unique RX port registers can be accessed by I2C read and write commands.

It is recommended to set bit four in the FPD-Link III capabilities register to one, to flag errors detected from the enhanced CRC on FPD-Link III encoded link control information. The FPD-Link III Encoder CRC must also be enabled by setting the FPD3\_ENC\_CRC\_DIS (register 0xBA[7]) to 0.

#### Table 7-84. FPD3 CAP (Address 0x4A)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:5	RESERVED	R/W	0x0	Reserved
4	FPD3_ENC_CRC_C AP	R/W	111711	Disable CRC error flag from FPD-Link III encoder     Enable CRC error flag from FPD-Link III encoder (recommended)
3:0	RESERVED	R/W	0x0	Reserved

## 7.6.67 RAW\_EMBED\_DTYPE Register

RX port specific register. The FPD-Link III Port Select register 0x4C configures which unique RX port registers can be accessed by I2C read and write commands.

When the receiver is programmed for Raw mode data, this register field allows setting the Data Type field for the first N lines to indicated embedded non-image data. RAW\_EMBED\_DTYPE has no effect on CSI-2 receiver modes.

### Table 7-85. RAW\_EMBED\_DTYPE (Address 0x4B)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:6	EMBED_DTYPE_EN	R/W	0x00	Embedded Data Type Enable. 00 : All long packets will be forwarded as RAW10 or RAW12 video data 01, 10, or 11 : Send first N long packets (1, 2, or 3) as Embedded data using the data type in the EMBED_DTYPE_ID field of this register. This control has no effect if the Receiver is programmed to receive CSI formatted data.
5:0	EMBED_DTYPE_ID	R/W	0x12	Embedded Data Type. If sending embedded data is enabled via the EMBED_DTYPE_EN control in this register, the Data Type field for the first N lines of each frame will use this value rather than the value programmed in the RAW12_ID or RAW10_ID registers. The default setting matches the CSI-2 specification for Embedded 8-bit non Image Data

# 7.6.68 FPD3\_PORT\_SEL Register

The FPD-Link III Port Select register configures which port is accessed in I2C commands to unique Rx Port registers 0x4A, 0x4B, 0x4D - 0x7F and 0xD0 - 0xDF. A 2-bit RX\_READ\_PORT field provides for reading values from a single port. The 4-bit RX\_WRITE\_PORT field provides individual enables for each port, allowing simultaneous writes broadcast to both of the FPD-Link III Receive port register blocks in unison. The DS90UB936-Q1 maintains separate page control, preventing conflict between sources.

Table 7-86. FPD3\_PORT\_SEL (Address 0x4C)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7	RESERVED	R	0x0	Reserved
6	PHYS_PORT_NUM	R	0x0 Port#	Physical port number This field provides the physical port connection when reading from a remote device via the Bi-directional Control Channel. When accessed via local I2C interfaces, the value returned is always 0. When accessed via Bi-directional Control Channel, the value returned is the port number of the Receive port connection.
5	RESERVED	R	0x0	Reserved
4	RX_READ_PORT	R/W	0x0 Port#	Select RX port for register read This field selects one of the two RX port register blocks for readback. This applies to all paged FPD-Link III Receiver port registers. 0: Port 0 registers 1: Port 1 registers When accessed via local I2C interfaces, the default setting is 0. When accessed via Bi-directional Control Channel, the default value is the port number of the Receive port connection.
3:2	RESERVED	R	0x00	Reserved
1	RX_WRITE_PORT_1	R/W	0x0 0x1 for RX Port 1	Write Enable for RX port 1 registers This bit enables writes to RX port 1 registers. Any combination of RX port registers can be written simultaneously. This applies to all paged FPD-Link III Receiver port registers.  0: Writes disabled 1: Writes enabled When accessed via Bi-directional Control Channel, the default value is 1 if accessed over RX port 1.
0	RX_WRITE_PORT_0	R/W	0x0 0x1 for RX Port 0	Write Enable for RX port 0 registers This bit enables writes to RX port 0 registers. Any combination of RX port registers can be written simultaneously. This applies to all paged FPD-Link III Receiver port registers. 0: Writes disabled 1: Writes enabled When accessed via Bi-directional Control Channel, the default value is 1 if accessed over RX port 0.

# 7.6.69 RX\_PORT\_STS1 Register

RX port specific register. The FPD-Link III Port Select register 0x4C configures which unique RX port registers can be accessed by I2C read and write commands.

Table 7-87. RX\_PORT\_STS1 (Address 0x4D)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7	RESERVED	R	0x0	Reserved
6	RX_PORT_NUM	R	0x0	RX Port Number. This read-only field indicates the number of the currently selected RX read port.
5	BCC_CRC_ERROR	R/RC	0x0	Bi-directional Control Channel CRC Error Detected This bit indicates a CRC error has been detected in the forward control channel. If this bit is set, an error may have occurred in the control channel operation. This bit is cleared on read.
4	LOCK_STS_CHG	R/RC	0x0	Lock Status Changed This bit is set if a change in receiver lock status has been detected since the last read of this register. Current lock status is available in the LOCK_STS bit of this register. This bit is cleared on read.
3	BCC_SEQ_ERROR	R/RC	0x0	Bi-directional Control Channel Sequence Error Detected This bit indicates a sequence error has been detected in the forward control channel. If this bit is set, an error may have occurred in the control channel operation. This bit is cleared on read.
2	PARITY_ERROR	R	0x0	FPD-Link III parity errors detected This flag is set when the number of parity errors detected is greater than the threshold programmed in the PAR_ERR_THOLD registers.  1: Number of FPD-Link III parity errors detected is greater than the threshold  0: Number of FPD-Link III parity errors is below the threshold This bit is cleared when the RX_PAR_ERR_HI/LO registers are cleared.
1	PORT_PASS	R	0x0	Receiver PASS indication. This bit indicates the current status of the Receiver PASS indication. The requirements for setting the Receiver PASS indication are controlled by the PORT_PASS_CTL register.  1: Receive input has met PASS criteria  0: Receive input does not meet PASS criteria
0	LOCK_STS	R	0x0	FPD-Link III receiver is locked to incoming data  1: Receiver is locked to incoming data  0: Receiver is not locked

94

### 7.6.70 RX\_PORT\_STS2 Register

RX port specific register. The FPD-Link III Port Select register 0x4C configures which unique RX port registers can be accessed by I2C read and write commands.

Table 7-88. RX\_PORT\_STS2 (Address 0x4E)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7	LINE_LEN _UNSTABLE	R/RC	0x0	Line Length Unstable If set, this bit indicates the line length was detected as unstable during a previous video frame. The line length is considered to be stable if all the lines in the video frame have the same length. This flag will remain set until read.
6	LINE_LEN_CHG	R/RC	0x0	Line Length Changed 1: Change of line length detected 0: Change of line length not detected This bit is cleared on read.
5	FPD3_ENCODE _ERROR	R/RC	0x0	FPD-Link III Encoder error detected If set, this flag indicates an error in the FPD-Link III encoding has been detected by the FPD-Link III receiver.  This bit is cleared on read.  Note, to detect FP3 Encoder errors, the LINK_ERROR_COUNT must be enabled with a LINK_ERR_THRESH value greater than 1.  Otherwise, the loss of Receiver Lock will prevent detection of the Encoder error.
4	BUFFER_ERROR	R/RC	0x0	Packet buffer error detected. If this bit is set, an overflow condition has occurred on the packet buffer FIFO.  1: Packet Buffer error detected  0: No Packet Buffer errors detected This bit is cleared on read.
3	CSI_ERROR	R	0x0	CSI Receive error detected. See the CSI_RX_STS register for details.
2	FREQ_STABLE	R	0x0	Frequency measurement stable
1	CABLE_FAULT	R	0x0	When link is expected to be operational, CABLE_FAULT would indicate open or short on the cable as no FPD-Link clock is detected at the deserializer Rx input.
0	LINE_CNT_CHG	R/RC	0x0	Line Count Changed 1: Change of line count detected 0: Change of line count not detected This bit is cleared on read.

#### 7.6.71 RX\_FREQ\_HIGH Register

RX port specific register. The FPD-Link III Port Select register 0x4C configures which unique RX port registers can be accessed by I2C read and write commands.

Table 7-89. RX\_FREQ\_HIGH (Address 0x4F)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	FREQ_CNT_HIGH	R	0x00	Frequency Counter High Byte (MHz) The Frequency counter reports the measured frequency for the FPD-Link III Receiver. This portion of the field is the integer value in MHz.

#### 7.6.72 RX\_FREQ\_LOW Register

RX port specific register. The FPD-Link III Port Select register 0x4C configures which unique RX port registers can be accessed by I2C read and write commands.

# Table 7-90. RX\_FREQ\_LOW (Address 0x50)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	FREQ_CNT_LOW	R	0×00	Frequency Counter Low Byte (1/256 MHz) The Frequency counter reports the measured frequency for the FPD-Link III Receiver. This portion of the field is the fractional value in 1/256 MHz.

### 7.6.73 SENSOR\_STS\_0 Register

RX port specific register. The FPD-Link III Port Select register 0x4C configures which unique RX port registers can be accessed by I2C read and write commands.

Sensor Status Register 0 field provides additional status information when paired with a DS90UB935-Q1 Serializer. This field is automatically loaded from the forward channel.

Table 7-91. SENSOR\_STS\_0 (Address 0x51)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:6	RESERVED	R	0x00	Reserved
5	CSI_ALARM	R	0x0	Alarm flag for CSI error from serializer
4	BCC_ALARM	R	0x0	Alarm flag for back channel error from serializer
3	LINK_DETECT_ALA RM	R	0x0	Alarm flag for link detect from serializer
2	TEMP_SENSE_ALA RM	R	0x0	Alarm flag for temp sensor from serializer
1	VOLT1_SENSE_ALA RM	R	0x0	Alarm flag for voltage sensor 1 from serializer
0	VOLT0_SENSE_ALA RM	R	0x0	Alarm flag for voltage sensor 0 from serializer

## 7.6.74 SENSOR\_STS\_1 Register

RX port specific register. The FPD-Link III Port Select register 0x4C configures which unique RX port registers can be accessed by I2C read and write commands.

Sensor Status Register 1 field provides additional status information when paired with a DS90UB935-Q1 Serializer. This field is automatically loaded from the forward channel.

Table 7-92. SENSOR\_STS\_1 (Address 0x52)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7	RESERVED	R	0x0	Reserved
6:4	VOLT1_SENSE_LEV EL	R	0x0	Voltage sensor sampled value from serializer
3	RESERVED	R	0x0	Reserved
2:0	VOLT0_SENSE_LEV EL	R	0x0	Voltage sensor sampled value from serializer

#### 7.6.75 SENSOR STS 2 Register

RX port specific register. The FPD-Link III Port Select register 0x4C configures which unique RX port registers can be accessed by I2C read and write commands.

Sensor Status Register 2 field provides additional status information when paired with a DS90UB935-Q1 Serializer. This field is automatically loaded from the forward channel.

Table 7-93. SENSOR\_STS\_2 (Address 0x53)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:3	RESERVED	R	0x0	
2:0	TEMP_SENSE_LEVE L	R	0x0	Temperature sensor sampled value from serializer

### 7.6.76 SENSOR\_STS\_3 Register

RX port specific register. The FPD-Link III Port Select register 0x4C configures which unique RX port registers can be accessed by I2C read and write commands.

Sensor Status Register 3 field provides additional status information on the CSI-2 input when paired with a DS90UB935-Q1 Serializer. This field is automatically loaded from the forward channel.

Table 7-94. SENSOR\_STS\_3 (Address 0x54)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:5	RESERVED	R	0x0	Reserved
4	CSI_ECC_2BIT_ERR	R	0x0	CSI -2 ECC error flag from serializer
3	CSI_CHKSUM_ERR	R	0x0	CSI-2 checksum error from serializer
2	CSI_SOT_ERR	R	0x0	CSI-2 start of transmission error from serializer
1	CSI_SYNC_ERR	R	0x0	CSI-2 synchronization error from serializer
0	CSI_CNTRL_ERR	R	0x0	CSI-2 control error from serializer

# 7.6.77 RX\_PAR\_ERR\_HI Register

RX port specific register. The FPD-Link III Port Select register 0x4C configures which unique RX port registers can be accessed by I2C read and write commands.

Table 7-95. RX\_PAR\_ERR\_HI (Address 0x55)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	PAR_ERROR _ BYTE_1	R/RC	0x0	Number of FPD-Link III parity errors 8 most significant bits. The parity error counter registers return the number of data parity errors that have been detected on the FPD-Link III Receiver data since the last detection of valid lock or last read of the RX_PAR_ERR_LO register. For accurate reading of the parity error count, disable the RX_PARITY_CHECKER_ENABLE bit in register 0x02 prior to reading the parity error count registers. This register is cleared upon reading the RX_PAR_ERR_LO register.

### 7.6.78 RX\_PAR\_ERR\_LO Register

RX port specific register. The FPD-Link III Port Select register 0x4C configures which unique RX port registers can be accessed by I2C read and write commands.

Table 7-96. RX PAR ERR LO (Address 0x56)

_	_ = (							
	BIT	FIELD	TYPE	DEFAULT	DESCRIPTION			
	7:0	PAR_ERROR _BYTE_0	R/RC	0x0	Number of FPD-Link III parity errors 8 least significant bits. The parity error counter registers return the number of data parity errors that have been detected on the FPD-Link III Receiver data since the last detection of valid lock or last read of the RX_PAR_ERR_LO register. For accurate reading of the parity error count, disable the RX_PARITY_CHECKER_ENABLE bit in register 0x02 prior to reading the parity error count registers. This register is cleared on read.			

#### 7.6.79 BIST\_ERR\_COUNT Register

RX port specific register. The FPD-Link III Port Select register 0x4C configures which unique RX port registers can be accessed by I2C read and write commands.

Table 7-97. BIST\_ERR\_COUNT (Address 0x57)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	BIST_ERROR _COUNT	R	( <b>) Y</b> ( )	Bist Error Count Returns BIST error count

# 7.6.80 BCC\_CONFIG Register

RX port specific register. The FPD-Link III Port Select register 0x4C configures which unique RX port registers can be accessed by I2C read and write commands.

Table 7-98. BCC\_CONFIG (Address 0x58)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7	I2C_PASS _THROUGH_ALL	R/W	0x0	I2C Pass-Through All Transactions 0: Disabled 1: Enabled
6	I2C_PASS _THROUGH	R/W	0x0	I2C Pass-Through to Serializer if decode matches 0: Pass-Through Disabled 1: Pass-Through Enabled
5	AUTO_ACK_ALL	R/W	0x0	Automatically Acknowledge all I2C writes independent of the forward channel lock state or status of the remote Acknowledge 1: Enable 0: Disable
4	BC_ALWAYS_ON	R/W	0x1	Back channel enable  1: Back channel is always enabled independent of I2C_PASS_THROUGH and I2C_PASS_THROUGH_ALL  0: Back channel enable requires setting of either I2C_PASS_THROUGH and I2C_PASS_THROUGH_ALL This bit may only be written through a local I2C controller.
3	BC_CRC _GENERATOR _ENABLE	R/W	0x1	Back Channel CRC Generator Enable 0: Disable 1: Enable
2:0	BC_FREQ_SELECT	R/W	S	Back Channel Frequency Select. Default value set by strap condition upon asserting PDB = HIGH.  000: 2.5 Mbps (select for DS90UB933-Q1 or DS90UB913A-Q1 compatibility)  001- 011: Reserved  010: 10 Mbps (select for non-synchronous back channel compatibility)  101: 25 Mbps  110: 50 Mbps (default for CSI Synchronous back channel compatibility)  111: Reserved  Note that changing this setting will result in some errors on the back channel for a short period of time. If set over the control channel, the Serializer should first be programmed to Auto-Ack operation to avoid a control channel timeout due to lack of response from the Deserializer.

### 7.6.81 DATAPATH\_CTL1 Register

RX port specific register. The FPD-Link III Port Select register 0x4C configures which unique RX port registers can be accessed by I2C read and write commands.

Table 7-99. DATAPATH\_CTL1 (Address 0x59)

			_ (	
BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7	OVERRIDE_FC _CONFIG	R/W	0x0	Disable loading of the DATAPATH_CTL registers from the forward channel, keeping locally written values intact     Allow forward channel loading of DATAPATH_CTL registers
6:2	RESERVED	R/W	0x0	Reserved
1:0	FC_GPIO_EN	R/W	0x0	Forward Channel GPIO Enable Configures the number of enabled forward channel GPIOs 00: GPIOs disabled 01: One GPIO 10: Two GPIOs 11: Four GPIOs This field is normally loaded from the remote serializer. It can be overwritten if the OVERRIDE_FC_CONFIG bit in this register is 1.

### 7.6.82 DATAPATH\_CTL2 Register

RX port specific register. The FPD-Link III Port Select register 0x4C configures which unique RX port registers can be accessed by I2C read and write commands.

# Table 7-100. DATAPATH CTL2 (Address 0x5A)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	RESERVED	R/W	0x0	Reserved

### 7.6.83 SER\_ID Register

RX port specific register. The FPD-Link III Port Select register 0x4C configures which unique RX port registers can be accessed by I2C read and write commands.

Table 7-101. SER\_ID (Address 0x5B)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:1	SER_ID	R/W	0x00	Remote Serializer ID This field is normally loaded automatically from the remote Serializer.
0	FREEZE_DEVICE_ID	R/W	0x0	Freeze Serializer Device ID Prevent auto-loading of the Serializer Device ID from the Forward Channel. The ID is frozen at the value written.

### 7.6.84 SER\_ALIAS\_ID Register

RX port specific register. The FPD-Link III Port Select register 0x4C configures which unique RX port registers can be accessed by I2C read and write commands.

Table 7-102. SER ALIAS ID (Address 0x5C)

Table 1 102. OLIC_ALIAO_ID (Addices 6x66)						
ВІТ	FIELD	TYPE	DEFAULT	DESCRIPTION		
7:1	SER_ALIAS_ID	R/W	0x0	7-bit Remote Serializer Alias ID Configures the decoder for detecting transactions designated for an I2C Target device attached to the remote Deserializer. The transaction is remapped to the address specified in the Target ID register. A value of 0 in this field disables access to the remote I2C Target.		
0	SER_AUTO_ACK	R/W	0x0	Automatically Acknowledge all I2C writes to the remote Serializer independent of the forward channel lock state or status of the remote Serializer Acknowledge  1: Enable  0: Disable		

### 7.6.85 TargetID[0] Register

RX port specific register. The FPD-Link III Port Select register 0x4C configures which unique RX port registers can be accessed by I2C read and write commands.

Table 7-103. TargetID[0] (Address 0x5D)

ВІТ	FIELD	TYPE	DEFAULT	DESCRIPTION
7:1	TARGET_ID0	R/W	0x0	7-bit Remote Target Device ID 0 Configures the physical I2C address of the remote I2C Target device attached to the remote Serializer. If an I2C transaction is addressed to the Target Alias IDO, the transaction is remapped to this address before passing the transaction across the Bidirectional Control Channel to the Serializer.
0	RESERVED	R	0x0	Reserved.

#### 7.6.86 TargetID[1] Register

RX port specific register. The FPD-Link III Port Select register 0x4C configures which unique RX port registers can be accessed by I2C read and write commands.

Table 7-104. TargetID[1] (Address 0x5E)

		145.0 7 10	··· · ·· ·· · · · · · · · · · · · · ·	1 (* taa: 000 0x02)
BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:1	TARGET_ID1	R/W	0x0	7-bit Remote Target Device ID 1 Configures the physical I2C address of the remote I2C Target device attached to the remote Serializer. If an I2C transaction is addressed to the Target Alias ID1, the transaction is remapped to this address before passing the transaction across the Bidirectional Control Channel to the Serializer.
0	RESERVED	R	0x0	Reserved.

# 7.6.87 TargetID[2] Register

RX port specific register. The FPD-Link III Port Select register 0x4C configures which unique RX port registers can be accessed by I2C read and write commands.

Table 7-105. TargetID[2] (Address 0x5F)

BI	IT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:	1	TARGET_ID2	R/W	0x0	7-bit Remote Target Device ID 2 Configures the physical I2C address of the remote I2C Target device attached to the remote Serializer. If an I2C transaction is addressed to the Target Alias ID2, the transaction is remapped to this address before passing the transaction across the Bidirectional Control Channel to the Serializer.
0	)	RESERVED	R	0x0	Reserved.

### 7.6.88 TargetID[3] Register

RX port specific register. The FPD-Link III Port Select register 0x4C configures which unique RX port registers can be accessed by I2C read and write commands.

Table 7-106. TargetID[3] (Address 0x60)

	BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
	7:1	TARGET_ID3	R/W	0x0	7-bit Remote Target Device ID 3 Configures the physical I2C address of the remote I2C Target device attached to the remote Serializer. If an I2C transaction is addressed to the Target Alias ID3, the transaction is remapped to this address before passing the transaction across the Bidirectional Control Channel to the Serializer.
ſ	0	RESERVED	R	0x0	Reserved.

### 7.6.89 TargetID[4] Register

RX port specific register. The FPD-Link III Port Select register 0x4C configures which unique RX port registers can be accessed by I2C read and write commands.

Table 7-107, TargetID[4] (Address 0x61)

14.10 1. 14.1 gett-[1.] (* 144.1000 one 1.)					
BIT	FIELD	TYPE	DEFAULT	DESCRIPTION	
7:1	TARGET_ID4	R/W	0x0	7-bit Remote Target Device ID 4 Configures the physical I2C address of the remote I2C Target device attached to the remote Serializer. If an I2C transaction is addressed to the Target Alias ID4, the transaction is remapped to this address before passing the transaction across the Bidirectional Control Channel to the Serializer.	
0	RESERVED	R	0x0	Reserved.	

### 7.6.90 TargetID[5] Register

RX port specific register. The FPD-Link III Port Select register 0x4C configures which unique RX port registers can be accessed by I2C read and write commands.

# Table 7-108. TargetID[5] (Address 0x62)

			9 [-]	(
BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:1	TARGET_ID5	R/W	0x0	7-bit Remote Target Device ID 5 Configures the physical I2C address of the remote I2C Target device attached to the remote Serializer. If an I2C transaction is addressed to the Target Alias ID5, the transaction is remapped to this address before passing the transaction across the Bidirectional Control Channel to the Serializer.
0	RESERVED	R	0x0	Reserved.

### 7.6.91 TargetID[6] Register

RX port specific register. The FPD-Link III Port Select register 0x4C configures which unique RX port registers can be accessed by I2C read and write commands.

Table 7-109. TargetID[6] (Address 0x63)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:1	TARGET_ID6	R/W	0x0	7-bit Remote Target Device ID 6 Configures the physical I2C address of the remote I2C Target device attached to the remote Serializer. If an I2C transaction is addressed to the Target Alias ID6, the transaction is remapped to this address before passing the transaction across the Bidirectional Control Channel to the Serializer.
0	RESERVED	R	0x0	Reserved.

### 7.6.92 TargetID[7] Register

RX port specific register. The FPD-Link III Port Select register 0x4C configures which unique RX port registers can be accessed by I2C read and write commands.

Table 7-110. TargetID[7] (Address 0x64)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:1	TARGET_ID7	R/W	0x0	7-bit Remote Target Device ID 7 Configures the physical I2C address of the remote I2C Target device attached to the remote Serializer. If an I2C transaction is addressed to the Target Alias ID7, the transaction is remapped to this address before passing the transaction across the Bidirectional Control Channel to the Serializer.
0	RESERVED	R	0x0	Reserved.

#### 7.6.93 TargetAlias[0] Register

RX port specific register. The FPD-Link III Port Select register 0x4C configures which unique RX port registers can be accessed by I2C read and write commands.

Table 7-111. TargetAlias[0] (Address 0x65)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:1	TARGET_ALIAS_ID0	R/W	0x0	7-bit Remote Target Device Alias ID 0 Configures the decoder for detecting transactions designated for an I2C Target device attached to the remote Serializer. The transaction is remapped to the address specified in the Target ID0 register. A value of 0 in this field disables access to the remote I2C Target.
0	TARGET_AUTO_AC K_0	R/W	0x0	Automatically Acknowledge all I2C writes to the remote Target 0 independent of the forward channel lock state or status of the remote Serializer Acknowledge 1: Enable 0: Disable

## 7.6.94 TargetAlias[1] Register

RX port specific register. The FPD-Link III Port Select register 0x4C configures which unique RX port registers can be accessed by I2C read and write commands.

Table 7-112. TargetAlias[1] (Address 0x66)

				<del>-</del> `
BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:1	TARGET_ALIAS_ID1	R/W		7-bit Remote Target Device Alias ID 1 Configures the decoder for detecting transactions designated for an I2C Target device attached to the remote Serializer. The transaction is remapped to the address specified in the Target ID1 register. A value of 0 in this field disables access to the remote I2C Target.

Table 7-112. TargetAlias[1] (Address 0x66) (continued)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
0	TARGET_AUTO_AC K_1	R/W	0x0	Automatically Acknowledge all I2C writes to the remote Target 1 independent of the forward channel lock state or status of the remote Serializer Acknowledge 1: Enable 0: Disable

### 7.6.95 TargetAlias[2] Register

RX port specific register. The FPD-Link III Port Select register 0x4C configures which unique RX port registers can be accessed by I2C read and write commands.

Table 7-113. TargetAlias[2] (Address 0x67)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:1	TARGET_ALIAS_ID2	R/W	0x0	7-bit Remote Target Device Alias ID 2 Configures the decoder for detecting transactions designated for an I2C Target device attached to the remote Serializer. The transaction is remapped to the address specified in the Target ID2 register. A value of 0 in this field disables access to the remote I2C Target.
0	TARGET_AUTO_ACK	R/W	0x0	Automatically Acknowledge all I2C writes to the remote Target 2 independent of the forward channel lock state or status of the remote Serializer Acknowledge 1: Enable 0: Disable

# 7.6.96 TargetAlias[3] Register

RX port specific register. The FPD-Link III Port Select register 0x4C configures which unique RX port registers can be accessed by I2C read and write commands.

Table 7-114. TargetAlias[3] (Address 0x68)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:1	TARGET_ALIAS_ID3	R/W	0×0	7-bit Remote Target Device Alias ID 3 Configures the decoder for detecting transactions designated for an I2C Target device attached to the remote Serializer. The transaction is remapped to the address specified in the Target ID3 register. A value of 0 in this field disables access to the remote I2C Target.
0	TARGET_AUTO_ACK _3	R/W	0x0	Automatically Acknowledge all I2C writes to the remote Target 3 independent of the forward channel lock state or status of the remote Serializer Acknowledge 1: Enable 0: Disable

## 7.6.97 TargetAlias[4] Register

RX port specific register. The FPD-Link III Port Select register 0x4C configures which unique RX port registers can be accessed by I2C read and write commands.

Table 7-115. TargetAlias[4] (Address 0x69)

	idolo i i ioi idigos mast il vidaroso exes,					
BIT	FIELD	TYPE	DEFAULT	DESCRIPTION		
7:1	TARGET_ALIAS_ID4	R/W	0x0	7-bit Remote Target Device Alias ID 4 Configures the decoder for detecting transactions designated for an I2C Target device attached to the remote Serializer. The transaction is remapped to the address specified in the Target ID4 register. A value of 0 in this field disables access to the remote I2C Target.		
0	TARGET_AUTO_AC K_4	R/W	0x0	Automatically Acknowledge all I2C writes to the remote Target 4 independent of the forward channel lock state or status of the remote Serializer Acknowledge 1: Enable 0: Disable		

### 7.6.98 TargetAlias[5] Register

RX port specific register. The FPD-Link III Port Select register 0x4C configures which unique RX port registers can be accessed by I2C read and write commands.

Table 7-116. TargetAlias[5] (Address 0x6A)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:1	TARGET_ALIAS_ID5	R/W	0x0	7-bit Remote Target Device Alias ID 5 Configures the decoder for detecting transactions designated for an I2C Target device attached to the remote Serializer. The transaction is remapped to the address specified in the Target ID5 register. A value of 0 in this field disables access to the remote I2C Target.
0	TARGET_AUTO_AC K_5	R/W	0x0	Automatically Acknowledge all I2C writes to the remote Target 5 independent of the forward channel lock state or status of the remote Serializer Acknowledge 1: Enable 0: Disable

# 7.6.99 TargetAlias[6] Register

RX port specific register. The FPD-Link III Port Select register 0x4C configures which unique RX port registers can be accessed by I2C read and write commands.

Table 7-117. TargetAlias[6] (Address 0x6B)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:1	TARGET_ALIAS_ID6	R/W	0x0	7-bit Remote Target Device Alias ID 6 Configures the decoder for detecting transactions designated for an I2C Target device attached to the remote Serializer. The transaction is remapped to the address specified in the Target ID6 register. A value of 0 in this field disables access to the remote I2C Target.
0	TARGET_AUTO_ACK _6	R/W	0x0	Automatically Acknowledge all I2C writes to the remote Target 6 independent of the forward channel lock state or status of the remote Serializer Acknowledge 1: Enable 0: Disable

## 7.6.100 TargetAlias[7] Register

RX port specific register. The FPD-Link III Port Select register 0x4C configures which unique RX port registers can be accessed by I2C read and write commands.

Table 7-118. TargetAlias[7] (Address 0x6C)

rabio i i i o i raigou mao [i ] (i tadi oco oxoc)					
BIT	FIELD	TYPE	DEFAULT	DESCRIPTION	
7:1	TARGET_ALIAS_ID7	R/W	0x0	7-bit Remote Target Device Alias ID 7 Configures the decoder for detecting transactions designated for an I2C Target device attached to the remote Serializer. The transaction is remapped to the address specified in the Target ID7 register. A value of 0 in this field disables access to the remote I2C Target.	
0	TARGET_AUTO_AC K 7	R/W	0x0	Automatically Acknowledge all I2C writes to the remote Target 7 independent of the forward channel lock state or status of the remote Serializer Acknowledge 1: Enable 0: Disable	

# 7.6.101 PORT\_CONFIG Register

RX port specific register. The FPD-Link III Port Select register 0x4C configures which unique RX port registers can be accessed by I2C read and write commands.

Table 7-119. PORT\_CONFIG (Address 0x6D)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7	CSI_WAIT_FS1	R/W	0x0	CSI Wait for FrameStart packet with count 1 The CSI Receiver will wait for a Frame Start packet with count of 1 before accepting other packets
6	CSI_WAIT_FS	R/W	0x1	CSI Wait for FrameStart packet CSI-2 Receiver will wait for a Frame Start packet before accepting other packets
5	CSI_FWD_CKSUM	R/W	0x1	Forward CSI packets with checksum errors 0: Do not forward packets with errors 1: Forward packets with errors
4	CSI_FWD_ECC	R/W	0x1	Forward CSI packets with ECC errors 0: Do not forward packets with errors 1: Forward packets with errors
3	CSI_FWD_LEN/ DISCARD_1ST _LINE_ON_ERR	R/W	0x1	In CSI FPD-Link III Input Mode, Forward CSI packets with length errors. In RAW Input Mode, forward truncated 1st video line.  0: CSI: Do not forward packets with errors. RAW: Forward truncated 1st video line  1: CSI: Forward packets with errors. RAW: Discard truncated 1st video line
2	COAX_MODE	R/W	S	Enable coax cable mode Default value set by strap condition of MODE pin upon asserting PDB = HIGH at start-up. 0: Shielded-twisted pair (STP) mode 1: Coax mode
1:0	FPD3_MODE	R/W	S	FPD-Link III Input Mode Default value set by strap condition of MODE pin upon asserting PDB = HIGH at start-up. 00: CSI Mode (DS90UB935 compatible) 01: RAW12 Mode/50 MHz (DS90UB913A/933 compatible) 10: RAW12 Mode/75 MHz (DS90UB913A/933 compatible) 11: RAW10 Mode/100 MHz (DS90UB913A/933 compatible)

# 7.6.102 BC\_GPIO\_CTL0 Register

RX port specific register. The FPD-Link III Port Select register 0x4C configures which unique RX port registers can be accessed by I2C read and write commands.

Table 7-120. BC\_GPIO\_CTL0 (Address 0x6E)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:4	BC_GPIO1_SEL	R/W	0x8	Back channel GPIO1 Select: Determines the data sent on GPIO1 for the port back channel.  0xxx: Pin GPIOx where x is BC_GPIO1_SEL[2:0]  0111: Reserved  1000: Constant value of 0  1001: Constant value of 1  1010: FrameSync signal  1011 - 1111: Reserved
3:0	BC_GPIO0_SEL	R/W	0x8	Back channel GPIO0 Select: Determines the data sent on GPIO0 for the port back channel. 0xxx: Pin GPIOx where x is BC_GPIO0_SEL[2:0] 0111: Reserved 1000: Constant value of 0 1001: Constant value of 1 1010: FrameSync signal 1011 - 1111: Reserved

### 7.6.103 BC\_GPIO\_CTL1 Register

RX port specific register. The FPD-Link III Port Select register 0x4C configures which unique RX port registers can be accessed by I2C read and write commands.

Table 7-121. BC GPIO CTL1 (Address 0x6F)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:4	BC_GPIO3_SEL	R/W	0x8	Back channel GPIO3 Select: Determines the data sent on GPIO3 for the port back channel.  0xxx: Pin GPIOx where x is BC_GPIO3_SEL[2:0] 0111: Reserved 1000: Constant value of 0 1001: Constant value of 1 1010: FrameSync signal 1011 - 1111: Reserved
3:0	BC_GPIO2_SEL	R/W	0x8	Back channel GPIO2 Select: Determines the data sent on GPIO2 for the port back channel.  0xxx: Pin GPIOx where x is BC_GPIO2_SEL[2:0] 0111: Reserved 1000: Constant value of 0 1001: Constant value of 1 1010: FrameSync signal 1011 - 1111: Reserved

#### 7.6.104 RAW10\_ID Register

RX port specific register. The FPD-Link III Port Select register 0x4C configures which unique RX port registers can be accessed by I2C read and write commands.

RAW10 virtual channel mapping only applies when FPD-Link III operating in RAW10 input mode. See register 0x71 for RAW12 and register 0x72 for CSI-2 mode operation.

Table 7-122. RAW10\_ID (Address 0x70)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:6	RAW10_VC	R/W	<rx #="" port=""></rx>	RAW10 Mode Virtual Channel This field configures the CSI Virtual Channel assigned to the port when receiving RAW10 data. The field value defaults to the FPD-Link III receive port number (0 or 1)
5:0	RAW10_DT	R/W	0x2B	RAW10 DT This field configures the CSI data type used in RAW10 mode. The default of 0x2B matches the CSI specification.

### 7.6.105 RAW12\_ID Register

RX port specific register. The FPD-Link III Port Select register 0x4C configures which unique RX port registers can be accessed by I2C read and write commands.

RAW12 virtual channel mapping only applies when FPD-Link III operating in RAW12 input mode. See register 0x70 for RAW10 and register 0x72 for CSI-2 mode operation.

Table 7-123. RAW12\_ID (Address 0x71)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION			
7:6	RAW12_VC	R/W		RAW12 Mode Virtual Channel This field configures the CSI Virtual Channel assigned to the port when receiving RAW12 data. The field value defaults to the FPD-Link III receive port number (0 or 1)			

Table 7-123. RAW12\_ID (Address 0x71) (continued)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
5:0	RAW12_DT	R/W		RAW12 DT This field configures the CSI data type used in RAW12 mode. The default of 0x2C matches the CSI specification.

## 7.6.106 CSI\_VC\_MAP Register

RX port specific register. The FPD-Link III Port Select register 0x4C configures which unique RX port registers can be accessed by I2C read and write commands.

CSI virtual channel mapping only applies when FPD-Link III operating in CSI-2 input mode. See registers 0x70 and 0x71 for RAW mode operation.

Table 7-124. CSI\_VC\_MAP (Address 0x72)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	CSI_VC_MAP	R/W	0xE4	CSI-2 Virtual Channel Mapping Register This register provides a method for replacing the Virtual Channel Identifier (VC-ID) of incoming CSI packets. [7:6]: Map value for VC-ID of 3 [5:4]: Map value for VC-ID of 2 [3:2]: Map value for VC-ID of 1 [1:0]: Map value for VC-ID of 0

### 7.6.107 LINE\_COUNT\_HI Register

RX port specific register. The FPD-Link III Port Select register 0x4C configures which unique RX port registers can be accessed by I2C read and write commands.

Table 7-125. LINE COUNT HI (Address 0x73)

_					<u> </u>
	BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
	7:0	LINE_COUNT_HI	R		High byte of Line Count The Line Count reports the line count for the most recent video frame. When interrupts are enabled for the Line Count (via the IE_LINE_CNT_CHG register bit), the Line Count value is frozen until read.

## 7.6.108 LINE\_COUNT\_LO Register

RX port specific register. The FPD-Link III Port Select register 0x4C configures which unique RX port registers can be accessed by I2C read and write commands.

Table 7-126. LINE\_COUNT\_LO (Address 0x74)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	LINE_COUNT_LO	R	0x0	Low byte of Line Count The Line Count reports the line count for the most recent video frame. When interrupts are enabled for the Line Count (via the IE_LINE_CNT_CHG register bit), the Line Count value is frozen until read. In addition, when reading the LINE_COUNT registers, the LINE_COUNT_LO is latched upon reading LINE_COUNT_HI to ensure consistency between the two portions of the Line Count.

### 7.6.109 LINE\_LEN\_1 Register

Table 7-127. LINE\_LEN\_1 (Address 0x75)

ВІТ	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	LINE_LEN_HI	R		High byte of Line Length The Line Length reports the line length recorded during the most recent video frame. If line length is not stable during the frame, this register will report the length of the last line in the video frame. When interrupts are enabled for the Line Length (via the IE_LINE_LEN_CHG register bit), the Line Length value is frozen until read.

## 7.6.110 LINE\_LEN\_0 Register

RX port specific register. The FPD-Link III Port Select register 0x4C configures which unique RX port registers can be accessed by I2C read and write commands.

Table 7-128. LINE\_LEN\_0 (Address 0x76)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	LINE_LEN_LO	R	0x0	Low byte of Line Length The Line Length reports the length of the most recent video line. When interrupts are enabled for the Line Length (via the IE_LINE_LEN_CHG register bit), the Line Length value is frozen until read. In addition, when reading the LINE_LEN registers, the LINE_LEN_LO is latched upon reading LINE_LEN_HI to ensure consistency between the two portions of the Line Length.

## 7.6.111 FREQ\_DET\_CTL Register

Table 7-129. FREQ\_DET\_CTL (Address 0x77)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:6	FREQ_HYST	R/W	0x3	Frequency Detect Hysteresis The Frequency detect hysteresis setting allows ignoring minor fluctuations in frequency. A new frequency measurement will be captured only if the measured frequency differs from the current measured frequency by more than the FREQ_HYST setting. The FREQ_HYST setting is in MHz.
5:4	FREQ_STABLE_THR	R/W	0x0	Frequency Stable Threshold The Frequency detect circuit can be used to detect a stable clock frequency. The Stability Threshold determines the amount of time required for the clock frequency to stay within the FREQ_HYST range to be considered stable: 00:40 µs 01:80 µs 10:320 µs 11:1.28 ms
3:0	FREQ_LO_THR	R/W	0x5	Frequency Low Threshold Sets the low threshold for the Clock frequency detect circuit in MHz. This value is used to determine if the clock frequency is too low for proper operation.

### 7.6.112 MAILBOX\_1 Register

RX port specific register. The FPD-Link III Port Select register 0x4C configures which unique RX port registers can be accessed by I2C read and write commands.

Table 7-130. MAILBOX\_1 (Address 0x78)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	MAILBOX_0	R/W		Mailbox Register This register is an unused read/write register that can be used for any purpose such as passing messages between I2C controllers on opposite ends of the link.

## 7.6.113 MAILBOX\_2 Register

RX port specific register. The FPD-Link III Port Select register 0x4C configures which unique RX port registers can be accessed by I2C read and write commands.

Table 7-131. MAILBOX\_2 (Address 0x79)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	MAILBOX_1	R/W	0x01	Mailbox Register This register is an unused read/write register that can be used for any purpose such as passing messages between I2C controllers on opposite ends of the link.

# 7.6.114 CSI\_RX\_STS Register

RX port specific register. The FPD-Link III Port Select register 0x4C configures which unique RX port registers can be accessed by I2C read and write commands.

Table 7-132. CSI\_RX\_STS (Address 0x7A)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:4	RESERVED	R	0x0	Reserved
3	LENGTH_ERR	R/RC	0x0	Packet Length Error detected for received CSI packet If set, this bit indicates a packet length error was detected on at least one CSI packet received from the sensor. Packet length errors occur if the data length field in the packet header does not match the actual data length for the packet.  1: One or more Packet Length errors have been detected 0: No Packet Length errors have been detected This bit is cleared on read.
2	CKSUM_ERR	R/RC	0x0	Data Checksum Error detected for received CSI packet If set, this bit indicates a data checksum error was detected on at least one CSI packet received from the sensor. Data checksum errors indicate an error was detected in the packet data portion of the CSI packet.  1: One or more Data Checksum errors have been detected 0: No Data Checksum errors have been detected This bit is cleared on read.
1	ECC2_ERR	R/RC	0x0	2-bit ECC Error detected for received CSI packet If set, this bit indicates a multi-bit ECC error was detected on at least one CSI packet received from the sensor. Multi-bit errors are not corrected by the device. 1: One or more multi-bit ECC errors have been detected 0: No multi-bit ECC errors have been detected This bit is cleared on read.
0	ECC1_ERR	R/RC	0x0	1-bit ECC Error detected for received CSI packet If set, this bit indicates a single-bit ECC error was detected on at least one CSI packet received from the sensor. Single-bit errors are corrected by the device.  1: One or more 1-bit ECC errors have been detected 0: No 1-bit ECC errors have been detected This bit is cleared on read.

# 7.6.115 CSI\_ERR\_COUNTER Register

RX port specific register. The FPD-Link III Port Select register 0x4C configures which unique RX port registers can be accessed by I2C read and write commands.

## Table 7-133. CSI\_ERR\_COUNTER (Address 0x7B)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	CSI_ERR_CNT	R/RC	0x00	CSI Error Counter Register This register counts the number of CSI packets received with errors since the last read of the counter.

# 7.6.116 PORT\_CONFIG2 Register

RX port specific register. The FPD-Link III Port Select register 0x4C configures which unique RX port registers can be accessed by I2C read and write commands.

## Table 7-134. PORT\_CONFIG2 (Address 0x7C)

Table 7-134. PORT_CONFIG2 (Address 0x7C)				
BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:6	RAW10_8BIT_CTL	R/W	0x0	Raw10 8-bit mode When Raw10 Mode is enabled for the port, the input data is processed as 8-bit data and packed accordingly for transmission over CSI.  00: Normal Raw10 Mode 01: Reserved 10: 8-bit processing using upper 8 bits. When selecting this value, change CSI data type value RAW10_DT in register 0x70[5:0] 11: 8-bit processing using lower 8 bits. When selecting this value, change CSI data type value RAW10_DT in register 0x70[5:0]
5	DISCARD_ON _PAR_ERR	R/W	0x1	Discard frames on Parity Error 0 : Forward packets with parity errors 1 : Truncate Frames if a parity error is detected
4	DISCARD_ON _LINE_SIZE	R/W	0x0	Discard frames on Line Size 0 : Allow changes in Line Size within packets 1 : Truncate Frames if a change in line size is detected
3	DISCARD_ON _FRAME_SIZE	R/W	0x0	Discard frames on change in Frame Size When enabled, a change in the number of lines in a frame will result in truncation of the packet. The device will resume forwarding video frames based on the PASS_THRESHOLD setting in the PORT_PASS_CTL register. 0 : Allow changes in Frame Size 1 : Truncate Frames if a change in frame size is detected
2	RESERVED	R/W	0x0	Reserved
1	LV_POLARITY	R/W	0x0	LineValid Polarity This register indicates the expected polarity for the LineValid indication received in Raw mode.  1: LineValid is low for the duration of the video line 0: LineValid is high for the duration of the video line
0	FV_POLARITY	R/W	0x0	FrameValid Polarity This register indicates the expected polarity for the FrameValid indication received in Raw mode. 1 : FrameValid is low for the duration of the video frame 0 : FrameValid is high for the duration of the video frame

## 7.6.117 PORT\_PASS\_CTL Register

RX port specific register. The FPD-Link III Port Select register 0x4C configures which unique RX port registers can be accessed by I2C read and write commands.

Table 7-135. PORT PASS CTL (Address 0x7D)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7	PASS_DISCARD_EN	R/W	0x0	Pass Discard Enable Discard packets if PASS is not indicated. 0 : Ignore PASS for forwarding packets 1 : Discard packets when PASS is not true
6	RESERVED	R/W	0x0	Reserved
5	PASS_LINE_CNT	R/W	0x0	Pass Line Count Control This register controls whether the device will include line count in qualification of the Pass indication: 0 : Don't check line count 1 : Check line count When checking line count, Pass is deasserted upon detection of a change in the number of video lines per frame. Pass will not be reasserted until the PASS_THRESHOLD setting is met.
4	PASS_LINE_SIZE	R/W	0x0	Pass Line Size Control This register controls whether the device will include line size in qualification of the Pass indication: 0 : Don't check line size 1 : Check line size When checking line size, Pass is deasserted upon detection of a change in video line size. Pass will not be reasserted until the PASS_THRESHOLD setting is met.
3	PASS_PARITY_ERR	R/W	x00	Parity Error Mode If this bit is set to 0, the port Pass indication is deasserted for every parity error detected on the FPD-Link III Receive interface. If this bit is set to a 1, the port Pass indication is cleared on a parity error and remain clear until the PASS_THRESHOLD is met. When PASS_PARITY_ERR is set to 1, TI also recommends setting PASS_THRESHOLD to 2 or higher to ensure at least one good frame occurs following a parity error
2	PASS_WDOG_DIS	R/W	0x0	RX Port Pass Watchdog disable When enabled, if the FPD Receiver does not detect a valid frame end condition within two video frame periods, the Pass indication is deasserted. The watchdog timer will not have any effect if the PASS_THRESHOLD is set to 0. 0 : Enable watchdog timer for RX Pass 1 : Disable watchdog timer for RX Pass
1:0	PASS_THRESHOLD	R/W	0x0	Pass Threshold Register This register controls the number of valid frames before asserting the port Pass indication. If set to 0, PASS is asserted after Receiver Lock detect. If non-zero, PASS is asserted following reception of the programmed number of valid frames.

## 7.6.118 SEN\_INT\_RISE\_CTL Register

Table 7-136. SEN\_INT\_RISE\_CTL (Address 0x7E)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	SEN_INT _RISE_MASK	R/W	0x0	Sensor Interrupt Rise Mask This register provides the interrupt mask for detecting rising edge transitions on the bits in SENSOR_STS_0. If a mask bit is set in this register, a rising edge transition on the corresponding SENSOR_STS_0 bit will generate an interrupt that will be latched in the SEN_INT_RISE_STS register.

# 7.6.119 SEN\_INT\_FALL\_CTL Register

RX port specific register. The FPD-Link III Port Select register 0x4C configures which unique RX port registers can be accessed by I2C read and write commands.

## Table 7-137. SEN\_INT\_FALL\_CTL (Address 0x7F)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	SEN_INT _FALL_MASK	R/W	0x0	Sensor Interrupt Fall Mask This register provides the interrupt mask for detecting falling edge transitions on the bits in SENSOR_STS_0. If a mask bit is set in this register, a falling edge transition on the corresponding SENSOR_STS_0 bit will generate an interrupt that will be latched in the SEN_INT_FALL_STS register.

### 7.6.120 RESERVED Register

## Table 7-138. RESERVED (Address 0xA0 - 0xA4)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	RESERVED	R/W	0x00	Reserved

## 7.6.121 REFCLK\_FREQ Register

### Table 7-139. REFCLK\_FREQ (Address 0xA5)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	REFCLK_FREQ	R	0x00	REFCLK frequency measurement in MHz. REFCLK_FREQ measurement is not synchronized. Value in this register should read twice and only considered valid if REFCLK_FREQ is unchanged between reads.

## 7.6.122 RESERVED Register

## Table 7-140. RESERVED (Address 0xA7 - 0xAF)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	RESERVED	R	0x00	Reserved

# 7.6.123 IND\_ACC\_CTL Register

# Table 7-141. IND\_ACC\_CTL (Address 0xB0)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:6	RESERVED	R	0x0	Reserved
5:2	IA_SEL	R/W	0x0	Indirect Access Register Select: Selects target for register access 0000 : CSI-2 Pattern Generator & Timing Registers 0001 : FPD-Link III RX Port 0 Reserved Registers 0010 : FPD-Link III RX Port 1 Reserved Registers 00011–0100: Reserved 0101 : FPD-Link III RX Shared Reserved Registers 0110 : Simultaneous write to FPD-Link III RX Reserved Registers 0111 : CSI-2 Reserved Registers 1000–1111 : Reserved
1	IA_AUTO_INC	R/W	0x0	Indirect Access Auto Increment: Enables auto-increment mode. Upon completion of a read or write, the register address will automatically be incremented by 1
0	IA_READ	R/W	0x0	Indirect Access Read: Setting this allows generation of a read strobe to the selected register block upon setting of the IND_ACC_ADDR register. In auto-increment mode, read strobes will also be asserted following a read of the IND_ACC_DATA register. This function is only required for blocks that need to pre-fetch register data.

## 7.6.124 IND\_ACC\_ADDR Register

# Table 7-142. IND\_ACC\_ADDR (Address 0xB1)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	IA_ADDR	R/W		Indirect Access Register Offset: This register contains the 8-bit register offset for the indirect access.

# 7.6.125 IND\_ACC\_DATA Register

### Table 7-143. IND\_ACC\_DATA (Address 0xB2)

				, , , , , , , , , , , , , , , , , , , ,
BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	IA_DATA	R/W	0x0	Indirect Access Data: Writing this register will cause an indirect write of the IND_ACC_DATA value to the selected analog block register. Reading this register will return the value of the selected block register

### 7.6.126 BIST Control Register

## Table 7-144. BIST Control (Address 0xB3)

			(/ taa: 000 0XD0)	
BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:6	BIST_OUT_MODE	R/W	0x0	BIST Output Mode 00 : Outputs disabled during BIST 01 : Reserved 10 : Outputs enabled during BIST 11 : Reserved
5:4	RESERVED	R/W	0x0	Reserved
3	BIST_PIN_CONFIG	R/W	0x1	Bist Configured through Pin.  1: Bist configured through pin.  0: Bist configured through bits 2:0 in this register
2:1	BIST_CLOCK _SOURCE	R/W	0x00	BIST Clock Source This register field selects the BIST Clock Source at the Serializer. These register bits are automatically written to the CLOCK SOURCE bits (register offset 0x14) in the Serializer after BIST is enabled. See the appropriate Serializer register descriptions for details. When connected to a DS90UB913A/ 933, a setting of 0x3 may result in a clock frequency that is too slow for proper recovery.
0	BIST_EN	R/W	0x0	BIST Control 1: Enabled 0: Disabled

### Table 7-149. MODE IDX STS (Address 0xB8)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7	IDX_DONE	R	0x1	IDX Done If set, indicates the IDX decode has completed and latched into the IDX status bits.
6:4	IDX	R	s	IDX Decode 3-bit decode from IDX pin
3	MODE_DONE	R	0x1	MODE Done If set, indicates the MODE decode has completed and latched into the MODE status bits.
2:0	MODE	R	S	MODE Decode 3-bit decode from MODE pin

## 7.6.132 LINK\_ERROR\_COUNT Register

## Table 7-150. LINK\_ERROR\_COUNT (Address 0xB9)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:6	RESERVED	R	0x0	Reserved
5	LINK_SFIL_WAIT	R/W	0x1	During SFILTER adaption, setting this bit will cause the Lock detect circuit to ignore errors during the SFILTER wait period after the SFILTER control is updated.  1: Errors during SFILTER Wait period will be ignored 0: Errors during SFILTER Wait period will not be ignored and may cause loss of Lock
4	LINK_ERR _COUNT_EN	R/W	0x1	Enable serial link data integrity error count  1: Enable error count  0: DISABLE
3:0	LINK_ERR _THRESH	R/W	0x3	Link error count threshold. The Link Error Counter monitors the forward channel link and determines when link will be dropped. The link error counter is pixel clock based. FPD Link parity, clock, and control are monitored for link errors. If the error counter is enabled, the deserializer will lose lock once the error counter reaches the LINK_ERR_THRESH value. If the link error counter is disabled, the deserilizer will lose lock after one error.

# 7.6.133 FPD3\_ENC\_CTL Register

It is recommended to enable CRC error checking on the FPD3 Encoder sequence to prevent any updates of link information values from encoded packets that do not pass CRC check. The FPD3 Encoder CRC is enabled by setting the FPD3\_ENC\_CRC\_DIS register 0xBA[7] to 0. In addition, the FPD3\_ENC\_CRC\_CAP flag should be set in register 0x4A[4].

### Table 7-151. FPD3\_ENC\_CTL (Address 0xBA)

ВІТ	FIELD	TYPE	DEFAULT	DESCRIPTION
7	FPD3_ENC_CRC_DI S	R/W	( <b>) Y 1</b>	Enable FPD-Link III encoder CRC (recommended)     Disable FPD-Link III encoder CRC

## 7.6.146 RESERVED Register

RX port specific register. The FPD-Link III Port Select register 0x4C configures which unique RX port registers can be accessed by I2C read and write commands.

### Table 7-164. RESERVED (Address 0xD7)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	RESERVED	R/W	0x00	Reserved

### 7.6.147 PORT\_ICR\_HI Register

Table 7-165. PORT\_ICR\_HI (Address 0xD8)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:3	RESERVED	R	0x0	Reserved
2	IE_FPD3_ENC_ERR	R/W	0x0	Interrupt on FPD-Link III Receiver Encoding Error When enabled, an interrupt is generated on detection of an encoding error on the FPD-Link III interface for the receive port as reported in the FPD3_ENC_ERROR bit in the RX_PORT_STS2 register
1	IE_BCC_SEQ_ERR	R/W	0x0	Interrupt on BCC SEQ Sequence Error. When enabled, an interrupt is generated if a Sequence Error is detected for the Bi-directional Control Channel forward channel receiver as reported in the BCC_SEQ_ERROR bit in the RX_PORT_STS1 register.
0	IE_BCC_CRC_ERR	R/W	0x0	Interrupt on BCC CRC error detect When enabled, an interrupt is generated if a CRC error is detected on a Bi-directional Control Channel frame received over the FPD-Link III forward channel as reported in the BCC_CRC_ERROR bit in the RX_PORT_STS1 register.

# 7.6.148 PORT\_ICR\_LO Register

RX port specific register. The FPD-Link III Port Select register 0x4C configures which unique RX port registers can be accessed by I2C read and write commands.

Table 7-166. PORT\_ICR\_LO (Address 0xD9)

ВІТ	FIELD	TYPE	DEFAULT	DESCRIPTION
7	RESERVED	R/W	0x0	Reserved
6	IE_LINE_LEN_CHG	R/W	0x0	Interrupt on Video Line length When enabled, an interrupt is generated if the length of the video line changes. Status is reported in the LINE_LEN_CHG bit in the RX_PORT_STS2 register.
5	IE_LINE_CNT_CHG	R/W	0x0	Interrupt on Video Line count When enabled, an interrupt is generated if the number of video lines per frame changes. Status is reported in the LINE_CNT_CHG bit in the RX_PORT_STS2 register.
4	IE_BUFFER_ERR	R/W	0x0	Interrupt on Receiver Buffer Error When enabled, an interrupt is generated if the Receive Buffer overflow is detected as reported in the BUFFER_ERROR bit in the RX_PORT_STS2 register.
3	IE_CSI_RX_ERR	R/W	0x0	Interrupt on CSI Receiver Error. When enabled, an interrupt will be generated on detection of an error by the CSI Receiver. CSI Receiver errors are reported in the CSI_RX_STS register (address 0x7A).
2	IE_FPD3_PAR_ERR	R/W	0x0	Interrupt on FPD-Link III Receiver Parity Error When enabled, an interrupt is generated on detection of parity errors on the FPD-Link III interface for the receive port. Parity error status is reported in the PARITY_ERROR bit in the RX_PORT_STS1 register.
1	IE_PORT_PASS	R/W	0x0	Interrupt on change in Port PASS status When enabled, an interrupt is generated on a change in receiver port valid status as reported in the PORT_PASS bit in the PORT_STS1 register.
0	IE_LOCK_STS	R/W	0x0	Interrupt on change in Lock Status When enabled, an interrupt is generated on a change in lock status. Status is reported in the LOCK_STS_CHG bit in the RX_PORT_STS1 register.

124

# 7.6.149 PORT\_ISR\_HI Register

Table 7-167. PORT\_ISR\_HI (Address 0xDA)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:5	Reserved	R	0x0	Reserved
4	IE_FC_GPIO	R	0x0	FC GPIO Interrupt Status A change in forward channel GPIO signal has been detected. Forward Channel GPIO status is reported in the FC_GPIO_STS register. This interrupt condition will be cleared by reading the FC_GPIO_STS register.
3	IE_FC_SENS_STS	R	0x0	Interrupt on change in Sensor Status A change in Sensor Status has been detected. Camera Status is reported in the SENSOR_STS_X registers. This interrupt condition will be cleared by reading the SEN_INT_RISE_STS and SEN_INT_FALL_STS registers.
2	IS_FPD3_ENC_ERR	R	0x0	FPD-Link III Receiver Encode Error Interrupt Status An encoding error on the FPD-Link III interface for the receive port has been detected. Status is reported in the FPD3_ENC_ERROR bit in the RX_PORT_STS2 register. This interrupt condition is cleared by reading the RX_PORT_STS2 register.
1	IS_BCC_SEQ_ERR	R	0x0	BCC CRC Sequence Error Interrupt Status A Sequence Error has been detected for the Bi- directional Control Channel forward channel receiver. Status is reported in the BCC_SEQ_ERROR bit in the RX_PORT_STS1 register. This interrupt condition is cleared by reading the RX_PORT_STS1 register.
0	IS_BCC_CRC_ERR	R	0x0	BCC CRC error detect Interrupt Status A CRC error has been detected on a Bi-directional Control Channel frame received over the FPD-Link III forward channel. Status is reported in the BCC_CRC_ERROR bit in the RX_PORT_STS1 register. This interrupt condition is cleared by reading the RX_PORT_STS1 register.

# 7.6.150 PORT\_ISR\_LO Register

Table 7-168. PORT\_ISR\_LO (Address 0xDB)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7	RESERVED	R	0x0	Reserved
6	IS_LINE_LEN_CHG	R	0x0	Video Line Length Interrupt Status A change in video line length has been detected. Status is reported in the LINE_LEN_CHG bit in the RX_PORT_STS2 register. This interrupt condition is cleared by reading the RX_PORT_STS2 register.
5	IS_LINE_CNT_CHG	R	0×0	Video Line Count Interrupt Status A change in number of video lines per frame has been detected. Status is reported in the LINE_CNT_CHG bit in the RX_PORT_STS2 register. This interrupt condition is cleared by reading the RX_PORT_STS2 register.
4	IS_BUFFER_ERR	R	0x0	Receiver Buffer Error Interrupt Status A Receive Buffer overflow has been detected as reported in the BUFFER_ERROR bit in the RX_PORT_STS2 register. This interrupt condition is cleared by reading the RX_PORT_STS2 register.
3	IS_CSI_RX_ERR	R	0x0	CSI Receiver Error Interrupt Status The CSI Receiver has detected an error. CSI Receiver errors are reported in the CSI_RX_STS register (address 0x7A). This interrupt condition will be cleared by reading the CSI_RX_STS register.
2	IS_FPD3_PAR_ERR	R	0x0	FPD-Link III Receiver Parity Error Interrupt Status A parity error on the FPD-Link III interface for the receive port has been detected. Parity error status is reported in the PARITY_ERROR bit in the RX_PORT_STS1 register. This interrupt condition is cleared by reading the RX_PORT_STS1 register.
1	IS_PORT_PASS	R	0x0	Port Valid Interrupt Status A change in receiver port valid status as reported in the PORT_PASS bit in the PORT_STS1 register. This interrupt condition is cleared by reading the RX_PORT_STS1 register.
0	IS_LOCK_STS	R	0x0	Lock Interrupt Status A change in lock status has been detected. Status is reported in the LOCK_STS_CHG bit in the RX_PORT_STS1 register. This interrupt condition is cleared by reading the RX_PORT_STS1 register.

# 7.6.151 FC\_GPIO\_STS Register

RX port specific register. The FPD-Link III Port Select register 0x4C configures which unique RX port registers can be accessed by I2C read and write commands.

Table 7-169. FC\_GPIO\_STS (Address 0xDC)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7	GPIO3_INT_STS	R/RC	0x0	GPIO3 Interrupt Status. This bit indicates an interrupt condition has been met for GPIO3. This bit is cleared on read.
6	GPIO2_INT_STS	R/RC	0x0	GPIO2 Interrupt Status. This bit indicates an interrupt condition has been met for GPIO2. This bit is cleared on read.
5	GPIO1_INT_STS	R/RC	0x0	GPIO1 Interrupt Status. This bit indicates an interrupt condition has been met for GPIO1. This bit is cleared on read.
4	GPIO0_INT_STS	R/RC	0x0	GPIO0 Interrupt Status. This bit indicates an interrupt condition has been met for GPIO0. This bit is cleared on read.
3	FC_GPIO3_STS	R	0x0	Forward Channel GPIO3 Status. This bit indicates the current value for forward channel GPIO3.
2	FC_GPIO2_STS	R	0x0	Forward Channel GPIO2 Status. This bit indicates the current value for forward channel GPIO2.
1	FC_GPIO1_STS	R	0x0	Forward Channel GPIO1 Status. This bit indicates the current value for forward channel GPIO1.
0	FC_GPIO0_STS	R	0x0	Forward Channel GPIO0 Status. This bit indicates the current value for forward channel GPIO0.

## 7.6.152 FC\_GPIO\_ICR Register

Table 7-170. FC\_GPIO\_ICR (Address 0xDD)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7	GPIO3_FALL_IE	R/W	0x0	GPIO3 Fall Interrupt Enable. If this bit is set, an interrupt will be generated based on detection of a falling edge on GPIO3.
6	GPIO3_RISE_IE	R/W	0x0	GPIO3 Rise Interrupt Enable. If this bit is set, an interrupt will be generated based on detection of a rising edge on GPIO3.
5	GPIO2_FALL_IE	R/W	0x0	GPIO2 Fall Interrupt Enable. If this bit is set, an interrupt will be generated based on detection of a falling edge on GPIO2.
4	GPIO2_RISE_IE	R/W	0x0	GPIO2 Rise Interrupt Enable.  If this bit is set, an interrupt will be generated based on detection of a rising edge on GPIO2.
3	GPIO1_FALL_IE	R/W	0x0	GPIO1 Fall Interrupt Enable. If this bit is set, an interrupt will be generated based on detection of a falling edge on GPIO1.
2	GPIO1_RISE_IE	R/W	0x0	GPIO1 Rise Interrupt Enable. If this bit is set, an interrupt will be generated based on detection of a rising edge on GPIO1.
1	GPIO0_FALL_IE	R/W	0x0	GPIO0 Fall Interrupt Enable. If this bit is set, an interrupt will be generated based on detection of a falling edge on GPIO0.

## Table 7-170. FC\_GPIO\_ICR (Address 0xDD) (continued)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
0	GPIO0_RISE_IE	R/W	0x0	GPIO0 Rise Interrupt Enable.  If this bit is set, an interrupt will be generated based on detection of a rising edge on GPIO0.

## 7.6.153 SEN\_INT\_RISE\_STS Register

RX port specific register. The FPD-Link III Port Select register 0x4C configures which unique RX port registers can be accessed by I2C read and write commands.

### Table 7-171. SEN\_INT\_RISE\_STS (Address 0xDE)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	SEN_INT_RISE	R/RC	0x00	Sensor Interrupt Rise Status. This register provides the interrupt status for rising edge transitions on the bits in SENSOR_STS_0. If a mask bit is set in the SEN_INT_RISE_MASK register, a rising edge transition on the corresponding SENSOR_STS_0 bit will generate an interrupt that will be latched in this register.

## 7.6.154 SEN\_INT\_FALL\_STS Register

RX port specific register. The FPD-Link III Port Select register 0x4C configures which unique RX port registers can be accessed by I2C read and write commands.

#### Table 7-172. SEN\_INT\_FALL\_STS (Address 0xDF)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	SEN_INT_FALL	R/RC	UXUU	Sensor Interrupt Fall Status. This register provides the interrupt status for falling edge transitions on the bits in SENSOR_STS_0. If a mask bit is set in the SEN_INT_RISE_MASK register, a falling edge transition on the corresponding SENSOR_STS_0 bit will generate an interrupt that will be latched in this register.

## 7.6.155 FPD3\_RX\_ID0 Register

### Table 7-173. FPD3\_RX\_ID0 (Address 0xF0)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	FPD3_RX_ID0	R	0x5F	FPD3_RX_ID0: First byte ID code: '_'

## 7.6.156 FPD3\_RX\_ID1 Register

#### Table 7-174, FPD3 RX ID1 (Address 0xF1)

ВІТ	FIELD	TYPE	DEFAULT	DESCRIPTION	
7:0	FPD3_RX_ID1	R	0x55	FPD3_RX_ID1: 2nd byte of ID code: 'U'	

### 7.6.157 FPD3\_RX\_ID2 Register

#### Table 7-175. FPD3\_RX\_ID2 (Address 0xF2)

					,
	BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
	7:0	FPD3_RX_ID2	R	0x42	FPD3_RX_ID2: 3rd byte of ID code: 'B'

### 7.6.158 FPD3\_RX\_ID3 Register

#### Table 7-176. FPD3 RX ID3 (Address 0xF3)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	FPD3_RX_ID3	R	0x39	FPD3_RX_ID3: 4th byte of ID code: '9'

### 7.6.159 FPD3\_RX\_ID4 Register

### Table 7-177. FPD3\_RX\_ID4 (Address 0xF4)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	FPD3_RX_ID4	R	0x35	FPD3_RX_ID4: 5th byte of ID code: '5'

#### 7.6.160 FPD3\_RX\_ID5 Register

#### Table 7-178. FPD3\_RX\_ID5 (Address 0xF5)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	FPD3_RX_ID5	R	0x34	FPD3_RX_ID5: 6th byte of ID code: '4'

### 7.6.161 I2C\_RX0\_ID Register

As an alternative to paging to access FPD-Link III receive port0 registers, a separate I2C address may be enabled to allow direct access to the port 0 specific registers. The I2C\_RX\_0\_ID register provides a simpler method of accessing device registers specifically for port 0 without having to use the paging function to select the register page. Using this address also allows access to all shared registers.

#### Table 7-179. I2C\_RX0\_ID (Address 0xF8)

ВІТ	FIELD	TYPE	DEFAULT	DESCRIPTION
7:1	RX_PORT0_ID	R/W	0x0	7-bit Receive Port 0 I2C ID Configures the decoder for detecting transactions designated for Receiver port 0 registers. A value of 0x00 in this field disables the Port0 decoder.
0	RESERVED	R	0x0	Reserved

### 7.6.162 I2C\_RX1\_ID Register

As an alternative to paging to access FPD-Link III receive port 1 registers, a separate I2C address may be enabled to allow direct access to the port 1 specific registers. The I2C\_RX\_1\_ID register provides a simpler method of accessing device registers specifically for port 1 without having to use the paging function to select the register page. Using this address also allows access to all shared registers.

#### Table 7-180. I2C RX1 ID (Address 0xF9)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:1	RX_PORT1_ID	R/W		7-bit Receive Port 1 I2C ID Configures the decoder for detecting transactions designated for Receiver port 1 registers. A value of 0x00 in this field disables the Port1 decoder.
0	RESERVED	R	0x0	Reserved

#### 7.6.163 RESERVED Register

### Table 7-182. RESERVED (Address 0xFB)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	RESERVED	R	0x00	Reserved

#### 7.6.165 Indirect Access Registers

Several functional blocks include register sets contained in the Indirect Access map (Table 7-183); that is, Pattern Generator, CSI-2 timing, and Analog controls. Register access is provided via an indirect access mechanism through the Indirect Access registers (IND\_ACC\_CTL, IND\_ACC\_ADDR, and IND\_ACC\_DATA). These registers are located at offsets 0xB0-0xB2 in the main register space.

The indirect address mechanism involves setting the control register to select the desired block, setting the register offset address, and reading or writing the data register. In addition, an auto-increment function is provided in the control register to automatically increment the offset address following each read or write of the data register.

For writes, the process is as follows:

- 1. Write to the IND\_ACC\_CTL register to select the desired register block
- 2. Write to the IND\_ACC\_ADDR register to set the register offset
- 3. Write the data value to the IND\_ACC\_DATA register

If auto-increment is set in the IND\_ACC\_CTL register, repeating step 3 will write additional data bytes to subsequent register offset locations

For reads, the process is as follows:

- 1. Write to the IND\_ACC\_CTL register to select the desired register block
- 2. Write to the IND\_ACC\_ADDR register to set the register offset
- 3. Read from the IND\_ACC\_DATA register

If auto-increment is set in the IND\_ACC\_CTL register, repeating step 3 will read additional data bytes from subsequent register offset locations.

#### 7.6.166

Table 7-183. Indirect Register Map Description

IA SELECT 0xB0[5:2]	PAGE/BLOCK	INDIRECT REGISTERS	ADDRESS RANGE	DESCRIPTION
0000	0	Digital Page 0 Indirect	0x01-0x1F	Pattern Gen Registers
0000	0	Registers	0x40-0x48	CSI TX port 0 Timing Registers
0001	1	FPD-Link III Channel 0 Reserved Registers	0x00-0x14	Test and Debug registers

## 7.6.167 Reserved Register

Table 7-184. Reserved (Indirect Address Page 0x00; Register 0x00)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	RESERVED	R	0x0	Reserved

## 7.6.168 PGEN\_CTL Register

# Table 7-185. PGEN\_CTL (Indirect Address Page 0x00; Register 0x01)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:1	RESERVED	R/W	0x0	Reserved
0	PGEN_ENABLE	R/W	0x0	Pattern Generator Enable 1: Enable Pattern Generator 0: Disable Pattern Generator

## 7.6.169 PGEN\_CFG Register

# Table 7-186. PGEN\_CFG (Indirect Address Page 0x00; Register 0x02)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7	PGEN_FIXED_EN	R/W	0x0	Fixed Pattern Enable Setting this bit enables Fixed Color Patterns. 0 : Send Color Bar Pattern 1 : Send Fixed Color Pattern
6	RESERVED	R/W	0x0	Reserved
5:4	NUM_CBARS	R/W	0x3	Number of Color Bars 00 : 1 Color Bar 01 : 2 Color Bars 10 : 4 Color Bars 11 : 8 Color Bars
3:0	BLOCK_SIZE	R/W	0x3	Block Size For Fixed Color Patterns, this field controls the size of the fixed color field in bytes. Allowed values are 1 to 15.

# 7.6.170 PGEN\_CSI\_DI Register

### Table 7-187. PGEN\_CSI\_DI (Indirect Address Page 0x00; Register 0x03)

п					, , , , , , , , , , , , , , , , , , , ,
	BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
	7:6	PGEN_CSI_VC	R/W	0x0	CSI Virtual Channel Identifier This field controls the value sent in the CSI packet for the Virtual Channel Identifier
	5:0	PGEN_CSI_DT	R/W	0x24	CSI Data Type This field controls the value sent in the CSI packet for the Data Type. The default value (0x24) indicates RGB888.

## 7.6.171 PGEN\_LINE\_SIZE1 Register

### Table 7-188. PGEN\_LINE\_SIZE1 (Indirect Address Page 0x00; Register 0x04)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	PGEN_LINE_SIZE[1 5:8]	R/W	0x07	Most significant byte of the Pattern Generator line size. This is the active line length in bytes. Default setting is for 1920 bytes for a 640 pixel line width.

# 7.6.172 PGEN\_LINE\_SIZE0 Register

## Table 7-189. PGEN\_LINE\_SIZE0 (Indirect Address Page 0x00; Register 0x05)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	PGEN_LINE_SIZE[7: 0]	R/W	0x80	Least significant byte of the Pattern Generator line size. This is the active line length in bytes. Default setting is for 1920 bytes for a 640 pixel line width.

### 7.6.173 PGEN\_BAR\_SIZE1 Register

## Table 7-190. PGEN\_BAR\_SIZE1 (Indirect Address Page 0x00; Register 0x06)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	PGEN_BAR_SIZE[15 :8]	R/W	0x0	Most significant byte of the Pattern Generator color bar size. This is the active length in bytes for the color bars. This value is used for all except the last color bar. The last color bar is determined by the remaining bytes as defined by the PGEN_LINE_SIZE value.

### 7.6.174 PGEN\_BAR\_SIZE0 Register

## Table 7-191. PGEN\_BAR\_SIZE0 (Indirect Address Page 0x00; Register 0x07)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	PGEN_BAR_SIZE[7: 0]	R/W	0xF0	Least significant byte of the Pattern Generator color bar size. This is the active length in bytes for the color bars. This value is used for all except the last color bar. The last color bar is determined by the remaining bytes as defined by the PGEN_LINE_SIZE value.

## 7.6.175 PGEN\_ACT\_LPF1 Register

## Table 7-192. PGEN\_ACT\_LPF1 (Indirect Address Page 0x00; Register 0x08)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	PGEN_ACT_LPF[15: 8]	R/W		Active Lines Per Frame Most significant byte of the number of active lines per frame. Default setting is for 480 active lines per frame.

## 7.6.176 PGEN\_ACT\_LPF0 Register

### Table 7-193. PGEN\_ACT\_LPF0 (Indirect Address Page 0x00; Register 0x09)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	PGEN_ACT_LPF[7:0]	R/W	0xE0	Active Lines Per Frame Least significant byte of the number of active lines per frame. Default setting is for 480 active lines per frame.

## 7.6.177 PGEN\_TOT\_LPF1 Register

# Table 7-194. PGEN\_TOT\_LPF1 (Indirect Address Page 0x00; Register 0x0A)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	PGEN_TOT_LPF[15: 8]	R/W		Total Lines Per Frame Most significant byte of the number of total lines per frame including vertical blanking

## 7.6.178 PGEN\_TOT\_LPF0 Register

# Table 7-195. PGEN\_TOT\_LPF0 (Indirect Address Page 0x00; Register 0x0B)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	PGEN_TOT_LPF[7:0]	R/W	0x0D	Total Lines Per Frame Least significant byte of the number of total lines per frame including vertical blanking

## 7.6.179 PGEN\_LINE\_PD1 Register

# Table 7-196. PGEN\_LINE\_PD1 (Indirect Address Page 0x00; Register 0x0C)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	PGEN_LINE_PD[15:8 ]	R/W	OXOC	Line Period Most significant byte of the line period in 10ns units. The default setting for the line period registers sets a line period of 31.75 microseconds.

### 7.6.180 PGEN\_LINE\_PD0 Register

## Table 7-197. PGEN\_LINE\_PD0 (Indirect Address Page 0x00; Register 0x0D)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	PGEN_LINE_PD[7:0]	R/W		Line Period Least significant byte of the line period in 10ns units. The default setting for the line period registers sets a line period of 31.75 microseconds.

## 7.6.181 PGEN\_VBP Register

#### Table 7-198. PGEN VBP (Indirect Address Page 0x00; Register 0x0E)

_									
	BIT	FIELD	TYPE	DEFAULT	DESCRIPTION				
	7:0	PGEN_VBP	R/W		Vertical Back Porch This value provides the vertical back porch portion of the vertical blanking interval. This value provides the number of blank lines between the FrameStart packet and the first video data packet.				

## 7.6.182 PGEN\_VFP Register

#### Table 7-199. PGEN VFP (Indirect Address Page 0x00: Register 0x0F)

				in the state of th
ВІТ	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	PGEN_VFP	R/W	0x0A	Vertical Front Porch This value provides the vertical front porch portion of the vertical blanking interval. This value provides the number of blank lines between the last video line and the FrameEnd packet.

## 7.6.183 PGEN\_COLOR0 Register

## Table 7-200. PGEN\_COLOR0 (Indirect Address Page 0x00; Register 0x10)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	PGEN_COLOR0	R/W	0xAA	Pattern Generator Color 0 For Reference Color Bar Patterns, this register controls the byte data value sent during color bar 0.For Fixed Color Patterns, this register controls the first byte of the fixed color pattern.

### 7.6.184 PGEN\_COLOR1 Register

## Table 7-201. PGEN\_COLOR1 (Indirect Address Page 0x00; Register 0x11)

	1 miles : 1 miles 1 miles _							
BIT	FIELD	TYPE	DEFAULT	DESCRIPTION				
7:0	PGEN_COLOR1	R/W	0x33	Pattern Generator Color 1 For Reference Color Bar Patterns, this register controls the byte data value sent during color bar 1. For Fixed Color Patterns, this register controls the second byte of the fixed color pattern.				

## 7.6.185 PGEN\_COLOR2 Register

## Table 7-202. PGEN\_COLOR2 (Indirect Address Page 0x00; Register 0x12)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	PGEN_COLOR2	R/W	0xF0	Pattern Generator Color 2 For Reference Color Bar Patterns, this register controls the byte data value sent during color bar 2. For Fixed Color Patterns, this register controls the third byte of the fixed color pattern.

### 7.6.186 PGEN\_COLOR3 Register

Table 7-203. PGEN\_COLOR3 (Indirect Address Page 0x00; Register 0x13)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	PGEN_COLOR3	R/W	0x7F	Pattern Generator Color 3 For Reference Color Bar Patterns, this register controls the byte data value sent during color bar 3. For Fixed Color Patterns, this register controls the fourth byte of the fixed color pattern.

## 7.6.187 PGEN\_COLOR4 Register

## Table 7-204. PGEN\_COLOR4 (Indirect Address Page 0x00; Register 0x14)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	PGEN_COLOR4	R/W		Pattern Generator Color 4 For Reference Color Bar Patterns, this register controls the byte data value sent during color bar 4. For Fixed Color Patterns, this register controls the fifth byte of the fixed color pattern.

### 7.6.188 PGEN\_COLOR5 Register

### Table 7-205. PGEN COLOR5 (Indirect Address Page 0x00; Register 0x15)

		<u>-</u>	(	
BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	PGEN_COLOR5	R/W		Pattern Generator Color 5 For Reference Color Bar Patterns, this register controls the byte data value sent during color bar 5. For Fixed Color Patterns, this register controls the sixth byte of the fixed color pattern.

### 7.6.189 PGEN\_COLOR6 Register

### Table 7-206. PGEN\_COLOR6 (Indirect Address Page 0x00; Register 0x16)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	PGEN_COLOR6	R/W	0x0F	Pattern Generator Color 6 For Reference Color Bar Patterns, this register controls the byte data value sent during color bar 6. For Fixed Color Patterns, this register controls the seventh byte of the fixed color pattern.

## 7.6.190 PGEN\_COLOR7 Register

### Table 7-207. PGEN\_COLOR7 (Indirect Address Page 0x00; Register 0x17)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	PGEN_COLOR7	R/W	0x80	Pattern Generator Color 7 For Reference Color Bar Patterns, this register controls the byte data value sent during color bar 7. For Fixed Color Patterns, this register controls the eighth byte of the fixed color pattern.

### 7.6.191 PGEN\_COLOR8 Register

# Table 7-208. PGEN\_COLOR8 (Indirect Address Page 0x00; Register 0x18)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	PGEN_COLOR8	R/W	0x0	Pattern Generator Color 8 For Fixed Color Patterns, this register controls the ninth byte of the fixed color pattern.

# 7.6.192 PGEN\_COLOR9 Register

#### Table 7-209. PGEN COLOR9 (Indirect Address Page 0x00; Register 0x19)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	PGEN_COLOR9	R/W		Pattern Generator Color 9 For Fixed Color Patterns, this register controls the tenth byte of the fixed color pattern.

### 7.6.193 PGEN\_COLOR10 Register

### Table 7-210. PGEN\_COLOR10 (Indirect Address Page 0x00; Register 0x1A)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	PGEN_COLOR10	R/W		Pattern Generator Color 10 For Fixed Color Patterns, this register controls the eleventh byte of the fixed color pattern.

## 7.6.194 PGEN\_COLOR11 Register

## Table 7-211. PGEN\_COLOR11 (Indirect Address Page 0x00; Register 0x1B)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	PGEN_COLOR11	R/W	0x0	Pattern Generator Color 11 For Fixed Color Patterns, this register controls the twelfth byte of the fixed color pattern.

### 7.6.195 PGEN\_COLOR12 Register

### Table 7-212. PGEN\_COLOR12 (Indirect Address Page 0x00; Register 0x1C)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	PGEN_COLOR12	R/W	0x0	Pattern Generator Color 12 For Fixed Color Patterns, this register controls the thirteenth byte of the fixed color pattern.

# 7.6.196 PGEN\_COLOR13 Register

## Table 7-213. PGEN\_COLOR13 (Indirect Address Page 0x00; Register 0x1D)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	PGEN_COLOR13	R/W	0x0	Pattern Generator Color 13 For Fixed Color Patterns, this register controls the fourteenth byte of the fixed color pattern.

## 7.6.197 PGEN\_COLOR14 Register

#### Table 7-214. PGEN COLOR14 (Indirect Address Page 0x00; Register 0x1E)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	PGEN_COLOR14	R/W	0x0	Pattern Generator Color 14 For Fixed Color Patterns, this register controls the fifteenth byte of the fixed color pattern.

### 7.6.198 RESERVED Register

# Table 7-215. RESERVED (Indirect Address Page 0x00; Register 0x1F)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:0	RESERVED	R/W	0x0	Reserved

## 7.6.199 CSI0\_TCK\_PREP Register

#### Table 7-216. CSI0 TCK PREP (Indirect Address Page 0x00; Register 0x40)

BIT	-	FIELD	TYPE	DEFAULT	DESCRIPTION
7		MR_TCK_PREP_OV	R/W		Override CSI Tck-prep parameter 0: Tck-prep is automatically determined 1: Override Tck-prep with value in bits 6:0 of this register
6:0		MR_TCK_PREP	R R/W	UXU	Tck-prep value If bit 7 of this register is 0, this field is read-only, indicating current automatically determined value. If bit 7 of this register is 1, this field is read/write.

## 7.6.200 CSI0\_TCK\_ZERO Register

# Table 7-217. CSI0\_TCK\_ZERO (Indirect Address Page 0x00; Register 0x41)

ВГ	IT FIELD		TYPE	DEFAULT DESCRIPTION	
7		MR_TCK_ZERO_OV	RW	0x0	Override CSI Tck-zero parameter 0: Tck-zero is automatically determined 1: Override Tck-zero with value in bits 6:0 of this register

If bit 7 of this register is 0, this field is read-only, indicating current automatically determined value.

# 7.6.207 CSI0\_TPLX Register

# Table 7-224. CSI0\_TPLX (Indirect Address Page 0x00; Register 0x48)

BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7	MR_TPLX_OV	R/W	0x0	Override CSI Tplx parameter 0: Tplx is automatically determined 1: Override Tplx with value in bits 6:0 of this register
6:0	MR_TPLX	R/W automatically determined value.		If bit 7 of this register is 0, this field is read-only, indicating current

# 8 Application and Implementation

#### Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 8.1 Application Information

#### **8.1.1 System**

The DS90UB936-Q1 is a highly integrated sensor hub chip which includes two FPD-Link III inputs targeted at ADAS applications, such as front-, rear-, and surround-view cameras, camera monitoring systems, and sensor fusion.

#### 8.1.2 Power Over Coax

The DS90UB936-Q1 is designed to support the Power-over-Coax (PoC) method of powering remote sensor systems. With this method, the power is delivered over the same medium (a coaxial cable) used for high-speed digital video data and bidirectional control and diagnostics data transmission. The method uses passive networks or filters that isolate the transmission line from the loading of the DC/DC regulator circuits and their connecting power traces on both sides of the link as shown in Figure 8-1.

Figure 8-1. Power Over Coax (PoC) System Diagram

The PoC networks' impedance of  $\geq 1~\mathrm{k}\Omega$  over a specific frequency band is recommended to isolate the transmission line from the loading of the regulator circuits. Higher PoC network impedance will contribute to favorable insertion loss and return loss characteristics in the high-speed channel. The lower limit of the frequency band is defined as ½ of the frequency of the bidirectional control channel,  $f_{BCC}$ . The upper limit of the frequency band is the frequency of the forward high-speed channel,  $f_{FC}$ . However, the main criteria that need to be met in the total high-speed channel, which consists of a serializer PCB, a deserializer PCB, and a cable, are the insertion loss and return loss limits defined in the Total Channel Requirements, while the system is under maximum current load and extreme temperature conditions<sup>(1)</sup> (2).

- 1. Contact TI for more information on the required Channel Specifications defined for each individual FPD-Link device.
- 2. The PoC network and any components along the high-speed trace on the PCB will contribute to the PCB loss budget. TI has recommendations for the loss budget allocation for each individual PCB and cable component in the overall high-speed channel, but the loss limits defined for the total channel in the Channel Specifications must be met.

Figure 8-2 shows a PoC network recommended for a 4G FPD-Link III consisting of DS90UB935-Q1 and DS90UB936-Q1 pair with the bidirectional channel operating at 50 Mbps (  $\frac{1}{2}$  f<sub>BCC</sub> = 25 MHz) and the forward channel operating at 4.16 Gbps (f<sub>FC</sub>  $\approx$  2.1 GHz).

Figure 8-2. Typical PoC Network for a 4G FPD-Link III

Table 8-1 lists essential components for this particular PoC network.

Table 8-1. Suggested Components for a 4G FPD-Link PoC Network

COUNT	REF DES	DESCRIPTION	PART NUMBER	MFR
		Inductor, 10 $\mu$ H, 0.288 $\Omega$ maximum, 530 mA minimum (Isat, Itemp) 30-MHz SRF min, 3 mm × 3 mm, General-Purpose	LQH3NPN100MJR	Murata
		Inductor, 10 $\mu$ H, 0.288 $\Omega$ maximum, 530 mA minimum (Isat, Itemp) 30-MHz SRF min, 3 mm × 3 mm, AEC-Q200	LQH3NPZ100MJR	Murata

Application report Sending Power over Coax in DS90UB913A Designs (SNLA224) discusses defining PoC networks in more detail.

In addition to the PoC network components selection, their placement and layout play a critical role as well.

- Place the smallest component, typically a ferrite bead or a chip inductor, as close to the connector as possible. Route the high-speed trace through one of its pads to avoid stubs.
- Use the smallest component pads as allowed by manufacturer's design rules. Add anti-pads in the inner planes below the component pads to minimize impedance drop.
- Consult with connector manufacturer for optimized connector footprint. If the connector is mounted on the same side as the IC, minimize the impactof the through-hole connector stubs by routing the high-speed signal traces on the opposite side of the connector mounting side.
- Use coupled  $100-\Omega$  differential signal traces from the device pins to the AC-coupling caps. Use  $50-\Omega$  single-ended traces from the AC-coupling capacitors to the connector.
- Terminate the inverting signal traces close to the connectors with standard 49.9-Ω resistors.

The suggested characteristics for single-ended PCB traces (microstrips or striplines) for serializer or descrializer boards are detailed in Table 8-3. The effects of the PoC networks must be accounted for when testing the traces for compliance to the suggested limits.

Table 8-3. Suggested Characteristics for Single-Ended PCB Traces With Attached PoC Networks

	PARAMETER	MIN	TYP	MAX	UNIT
L <sub>trace</sub>	Single-ended PCB trace length from the device pin to the connector pin			5	cm
Z <sub>trace</sub>	Single-ended PCB trace characteristic impedance	45	50	55	Ω
Z <sub>con</sub>	Connector (mounted) characteristic impedance	40	50	60	Ω
t <sub>∆Z_con</sub>	Allowable electrical length of the connector impedance discontinuity as measured with a TDR (100 ps edge)			20	ps

The  $V_{POC}$  noise must be kept to 10 mVp-p or lower on the source / deserializer side of the system. The  $V_{POC}$  fluctuations on the serializer side, caused by the transient current draw of the sensor and the DC resistance of cables and PoC components,must be kept at minimum as well. Increasing the  $V_{POC}$  voltage and adding extra decoupling capacitance (> 10  $\mu$ F) help reduce the amplitude and slew rate of the  $V_{POC}$  fluctuations.

### 8.2 Typical Application

Figure 8-4. Typical Connection Diagram Coaxial With Internal 1.1-V LDO

#### Note

- The decoupling capacitors for VDD11 are different between the two typical application diagrams because VDD\_SEL is pulled to different levels. See the *Pin Functions* table for more information.
- FB2, F3 may be required depending on system power supply noise levels
- FB1-FB4: DCR ≤ 25mΩ;  $Z = 120\Omega@100MHz$
- C1, C2, C3, C4 (see Design Parameters Values Table)
- R1, R2 (see IDX Resistor Values Table)
- R3, R4 (see MODE Resistor Values Table)
- RTERM =  $50\Omega$

Figure 8-5. Typical Connection Diagram STP With External 1.1-V supply

#### **Note**

- The decoupling capacitors for VDD11 are different between the two typical application diagrams because VDD\_SEL is pulled to different levels. See the *Pin Functions* table for more information.
- FB1-FB7: DCR ≤ 25mΩ; Z = 120Ω@100MHz
- C1, C2, C3, C4 (see Design Parameters Values Table)
- R1, R2 (see IDX Resistor Values Table)
- R3, R4 (see MODE Resistor Values Table)
- RTERM =  $50\Omega$

#### 8.2.1 Design Requirements

For the typical design application, use the parameters listed in Table 8-4.

**Table 8-4. Design Parameters** 

14.510 0 1	. Boolgii i didillotoro
DESIGN PARAMETER	EXAMPLE VALUE
V <sub>(VDDIO)</sub>	1.8 V or 3.3 V
V <sub>(VDD18)</sub>	1.8 V
V <sub>(VDD11)</sub> ( When VDD_SEL = HIGH)	1.1 V
AC-coupling Capacitor for Synchronous Modes, Coaxial Connection: RIN0+ ,RIN1+	33 nF - 100nF (50 WV 0402)
AC-coupling Capacitor for Synchronous Modes, Coaxial Connection: RIN0- ,RIN1-	15 nF - 47nF (50 WV 0402)
AC-coupling Capacitor for Synchronous Modes, STP Connection: RIN0± ,RIN1±	33 nF - 100nF (50 WV 0402)
AC-coupling Capacitor for Non-Synchronous and DVP Backwards Compatible Modes, Coaxial Connection: RIN0+, RIN1+	100 nF (50 WV 0402)
AC-coupling Capacitor for Non-Synchronous and DVP Backwards Compatible Modes, Coaxial Connection: RIN0-, RIN1-	47 nF (50 WV 0402)
AC-coupling Capacitor for Non-Synchronous and DVP Backwards Compatible Modes, STP Connection: RIN0±, RIN1±	100 nF (50 WV 0402)

The SER/DES supports only AC-coupled interconnects through an integrated DC-balanced decoding scheme. External AC-coupling capacitors must be placed in series in the FPD-Link III signal path as shown in Figure 8-6 and Figure 8-7. When connected to the DS90UB935-Q1 or DS90UB953-Q1 serializer operating with 10-Mbps back channel, the higher value AC-coupling capacitors are recommended to reduce low frequency attenuation. For applications using single-ended  $50-\Omega$  coaxial cable, terminate the unused data pins (RIN0–, RIN1–) with an AC-coupling capacitor and a  $50-\Omega$  resistor.

Figure 8-6. AC-Coupled Connection (Coaxial)

Figure 8-7. AC-Coupled Connection (STP)

For high-speed FPD-Link III transmissions, use the smallest available package for the AC-coupling capacitor to help minimize degradation of signal quality due to package parasitics.

# 8.2.2 Detailed Design Procedure

Figure 8-4 and Figure 8-5 show typical applications of the DS90UB936-Q1 for multi-camera surround view system. From Figure 8-4, the FPD-Link III is AC coupled an external 100-nF or 47-nF capacitors for coaxial interconnects. For 2G operation or back channel frequency of ≤ 10 Mbps, the higher value AC-coupling capacitors 100 nF /47 nF are recommended. The same AC-coupling capacitor values should be matched on the paired serializer boards. The deserializer has an internal termination. Bypass capacitors are placed near the power supply pins. At a minimum, 0.1-µF or 0.01-µF capacitors should be used for each of the core supply pins for local device bypassing. Additional bulk decoupling capacitors and ferrite beads are placed on the VDD18 supplies for effective noise suppression.

#### 8.2.3 Application Curves

#### 8.3 System Examples

The DS90UB936-Q1 has two input ports that are capable of operating independently. Two sensors can be connected simultaneously (Figure 8-12), or a single sensor can be connected to either Rx input port 0 or Rx input port 1 (Figure 8-13). The DS90UB936-Q1 deserializer is capable of receiving serialized sensor data from one or two independent video datastreams and aggregating into a single CSI-Tx output. Alternatively, Rx Data can be replicated onto two 2-Lane CSI-2 outputs for interconnect to two seperate CSI-2 Rx inputs for parallel downstream processing.

Figure 8-12. Two DS90UB935-Q1 Sensor Data onto CSI-2 Over 1 Port

Figure 8-13. One DS90UB935-Q1 Sensor Data onto CSI-2 Over 1 Port

Figure 8-14. DS90UB935-Q1 Sensor Data Replicated onto 2x 2-Lane CSI-2

Figure 8-15. One DS90UB935-Q1 and One DS90UB933-Q1 Sensor Data Combined to One CSI-2 Output

# 9 Power Supply Recommendations

This device provides separate power and ground pins for different portions of the circuit. This is done to isolate switching noise effects between different sections of the circuit. Separate planes on the PCB are typically not required. provides guidance on which circuit blocks are connected to which power pin pairs. In some cases, an external filter many be used to provide clean power to sensitive circuits such as PLLs.

# 9.1 VDD and VDDIO Power Supply

Each VDD power supply pin must have a 10-nF (or 100-nF) capacitor to ground connected as close as possible to DS90UB936-Q1 device. When operating VDDIO at 1.8-V nominal supply, the voltage at VDDIO must be within  $\pm 100$  mV of VDD18 to ensure VIH, VIL specifications. TI recommends having additional decoupling capacitors (1  $\mu$ F or 10  $\mu$ F) connected to a common GND plane. Note that although average current for VDDIO is less than 10 mA maximum, the peak current into VDDIO may exceed 100 mA on device start-up.

## 9.2 Power-Up Sequencing

The power-up sequence for the DS90UB936-Q1 is as follows:

Figure 9-1. Power Supply Sequencing VDD\_SEL = LOW, Internal VDD 1.1-V Supply

Figure 9-2. Power Supply Sequencing VDD SEL = HIGH, External VDD 1.1-V Supply

Table 9-1. Timing Diagram for the Power Supply Start-Up Sequence

	PARAMETER	MIN	TYP	MAX	UNIT	NOTES
T0	VDD18 rise time	0.05			ms	at 10/90%
T1	VDDIO rise time	0.2	1		ms	at 10/90%
T2	VDD18 High to VDD11 applied	0			ms	N/A when VDD_SEL = LOW
Т3	VDD11 rise time	0.2	1		ms	at 10/90%
T4	VDD to PDB	0			ms	After all VDD are stable
T5	PDB high time before PDB hard reset	1			ms	
T6	PDB high to low pulse width	2			ms	Hard reset (optional)
T7	PDB to I2C ready (IDX and MODE valid) delay	2			ms	

Note: VDDIO can come up either before or after VDD18.

#### 9.2.1 PDB Pin

The PDB pin is active HIGH and has internal 50 k $\Omega$  pull down resistor. PDB input must remain LOW while the VDD pin power supplies are in transition. Typically PDB will be connected to GPIO from processor also with internal pulldown. Alternatively, when VDD\_SEL = LOW, an external RC network on the PDB pin may be connected to ensure PDB arrives after all the supply pins have settled to the recommended operating voltage. When PDB pin is pulled up to VDD18, a 10-k $\Omega$  pullup and a > 10- $\mu$ F capacitor to GND are recommended to delay the PDB input signal rise. All inputs must not be driven until both power supplies have reached steady state. When VDD\_SEL = HIGH it is not recommended to connect PDB through RC circuit as this may conflict with the sequencing of the external 1.1-V supply rail.

Table 9-2. PDB Pin Pulse Width

	PARAMETER	TEST CONDITIONS	MIN	TYP	MAX UI	INIT
PDB						
tLRST	PDB Reset Low Pulse		2	3	n	ms

#### 9.2.2 System Initialization

When initializing the communications link between the DS90UB936-Q1 deserializer hub and a DS90UB935-Q1 serializer, the system timing will depend on the mode selected for generating the serializer reference clock. When synchronous clocking mode is selected, the serializer will re-lock onto the extracted back channel reference clock once available so there is no need for local crystal oscillator at the sensor module (Figure 9-3). When the DS90UB935-Q1 is operating in non-synchronous mode, or if connecting to DS90UB933-Q1 or DS90UB913A-Q1 serializer the sensor module requires a local reference clock and timing would follow Figure 9-4.

Figure 9-3. Power-Up Sequencing Synchronous Back Channel Clocking Mode, VDD\_SEL = LOW

Figure 9-4. Power-Up Sequencing Non-synchronous Back Channel Clocking Mode, VDD\_SEL = LOW

# 10 Layout

## 10.1 PCB Layout Guidelines

Circuit board layout and stack-up for the FPD-Link III devices must be designed to provide low-noise power feed to the device. Good layout practice also separates high-frequency or high-level inputs and outputs to minimize unwanted noise pickup, feedback, and interference. Power system performance may be greatly improved by using thin dielectrics (2 to 4 mils) for power or ground sandwiches. This arrangement provides plane capacitance for the PCB power system with low-inductance parasitics, which has proven especially effective at high frequencies, and makes the value and placement of external bypass capacitors less critical. External bypassing should be low-ESR ceramic capacitors with high-quality dielectric. The voltage rating of the ceramic capacitors must be at least 2× the power supply voltage being used.

TI recommends surface-mount capacitors due to their smaller parasitics. When using multiple capacitors per supply pin, locate the smaller value closer to the pin. A large bulk capacitor is recommend at the point of power entry. This is typically in the 47-µF to 100-µF range, which smooths low frequency switching noise. TI recommends connecting power and ground pins directly to the power and ground planes with bypass capacitors connected to the plane with via on both ends of the capacitor. Connecting power or ground pins to an external bypass capacitor increases the inductance of the path.

A small body size X7R chip capacitor, such as 0603 or 0402, is recommended for external bypass. Its small body size reduces the parasitic inductance of the capacitor. The user must pay attention to the resonance frequency of these external bypass capacitors, usually in the range of 20 to 30 MHz. To provide effective bypassing, multiple capacitors are often used to achieve low impedance between the supply rails over the frequency of interest. At high frequency, it is also a common practice to use two vias from power and ground pins to the planes, reducing the impedance at high frequency.

Some devices provide separate power and ground pins for different portions of the circuit. This is done to isolate switching noise effects between different sections of the circuit. Separate planes on the PCB are typically not required. Pin Description tables typically provide guidance on which circuit blocks are connected to which power pin pairs. In some cases, an external filter may be used to provide clean power to sensitive circuits such as PLLs

Use at least a four-layer board with a power and ground plane. Locate CSI-2 signals away from the single-ended or differential FPD RX input traces to prevent coupling from the CSI-2 signals to the RX inputs. The following sections provide important details for routing the FPD-Link III traces, PoC filter, and CSI-2 traces.

#### 10.1.1 Ground

TI recommends that a consistent ground plane reference for the high-speed signals in the PCB design to provide the best image plane for signal traces running parallel to the plane. Connect the thermal pad of the DS90UB936-Q1 to the GND plane with vias.

#### 10.1.2 Routing FPD-Link III Signal Traces and PoC Filter

Routing the FPD-Link III signal traces between the  $R_{\text{IN}}$  pins and the connector as well as connecting the PoC filter to these traces are the most critical pieces of a successful DS90UB936-Q1 PCB layout. Figure 10-1 shows an example PCB layout of the DS90UB936-Q1 configured for interface to remote sensor modules over coaxial cables. The layout example also uses a footprint of an edge-mount FAKRA connector provided by Rosenberger (P/N: 59S20X-40ML5-Z).

The following list provides essential recommendations for routing the FPD-Link III signal traces between the DS90UB936-Q1 receiver input pins ( $R_{IN}$ ) and the FAKRA connector, and connecting the PoC filter.

- The routing of the FPD-Link III traces may be all on the top layer (as shown in the example) or partially embedded in middle layers if EMI is a concern
- The AC-coupling capacitors should be on the top layer and very close to the DS90UB936-Q1 receiver input pins to minimize the length of coupled differential trace pair between the pins and the capacitors.
- Route the RIN+ trace between the AC-coupling capacitor and the FAKRA connector as a 50-Ω single-ended micro-strip with tight impedance control (±10%). Calculate the proper width of the trace for a 50-Ω impedance based on the PCB stack-up. Ensure that the trace can carry the PoC current for the maximum load presented by the remote sensor module.

• The PoC filter should be connected to the RIN+ trace through the first ferrite bead (FB<sub>1</sub>). The FB<sub>1</sub> should be touching the high-speed trace to minimize the stub length seen by the transmission line. Create an anti-pad or a moat under the FB<sub>1</sub> pad that touches the trace. The anti-pad should be a plane cutout of the ground plane directly underneath the top layer without cutting out the ground reference under the trace. The purpose of the anti-pad is to maintain the impedance as close to 50 Ω as possible.

• Route the RIN– trace loosely coupled to the RIN+ trace for the length similar to the RIN+ trace length when possible. This will help the differential nature of the receiver to cancel out any common-mode noise that may be present in the environment that may couple on to the RIN+ and RIN– signal traces. When routing on inner layers, length matching for single-ended traces does not provide as significant benefit.

When configured for STP and routing differential signals to the DS90UB936-Q1 receiver inputs, the traces should maintain  $100-\Omega$  differential impedance routed to the connector. When choosing to implement a common mode choke for common mode noise reduction, take care to minimize the effect of any mismatch. Figure 10-2 shows an example PCB layout for STP configuration.

#### 10.1.3 Routing CSI-2 Signal Traces

Routing the CSI-2 signal traces between the CSI-2 pins and the CSI-2 connector is also important for a successful DS90UB936-Q1 PCB layout. Figure 10-1 shows essential details for routing the CSI-2 traces. Additional recommendations are given in the following list:

- 1. Route CSI\_D0N, CSI\_D0P, CSI\_D1N, and CSI\_D1P pairs as differential coupled striplines with controlled 100-Ω differential impedance (±10%)
- 2. Keep the trace length difference between CSI-2 traces to 5 mils of each other.
- 3. Length matching should be near the location of mismatch.
- 4. Each pair should be separated at least by 5 times the signal trace width.
- 5. Keep away from other high-speed signals.
- 6. Keep the use of bends in differential traces to a minimum. When bends are used, the number of left and right bends must be as equal as possible, and the angle of the bend should be ≥ 135 degrees. This arrangement minimizes any length mismatch caused by the bends and therefore minimizes the impact that bends have on FMI
- 7. Route all differential pairs on one or two inner layers.
- 8. Keep the number of signal vias to a minimum TI recommends keeping the via count to the maximum of two per CSI-2 trace.
- 9. Keep traces on layers adjacent to ground plane.
- 10. Do NOT route differential pairs over any plane split.
- 11. Adding Test points causes impedance discontinuity and therefore negatively impacts signal performance. If test points are used, place them in series and symmetrically. Test points must not be placed in a manner that causes a stub on the differential pair.

## 10.2 Layout Examples

Figure 10-1. DS90UB936-Q1 PCB Layout Example: FPD-Link III Signal Traces and PoC Filter

## 11.3 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. Click on *Subscribe to updates* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

## 11.4 Support Resources

TI E2E<sup>™</sup> support forums are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

#### 11.5 Trademarks

TI E2E<sup>™</sup> is a trademark of Texas Instruments.

All trademarks are the property of their respective owners.

#### 11.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

#### 11.7 Glossary

TI Glossary

This glossary lists and explains terms, acronyms, and definitions.

# 12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

## 12.1 Package Option Addendum

**Packaging Information** 

Orderable Device	Status <sup>(1)</sup>	Package Type	Package Drawing	Pins   Fco Plan(2)		Lead/Ball Finish <sup>(4)</sup>	MSL Peak Temp <sup>(3)</sup>	Op Temp (°C)	Device Marking <sup>(5) (6)</sup>	
DS90UB936TRGZRQ1	ACTIVE	VQFN	RGZ	48	2500	RoHS & Green	NIPDAU	Level-3-260C-168 HR	-40 to 105	UB936Q
DS90UB936TRGZTQ1	ACTIVE	VQFN	RGZ	48	250	RoHS & Green	NIPDAU	Level-3-260C-168 HR	-40 to 105	UB936Q

1. The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PRE PROD Unannounced device, not in production, not available for mass market, nor on the web, samples not available.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

2. **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (CI) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

- MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
- 4. There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.
- 5. Multiple Device markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
- 6. Lead/Ball Finish Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

<sup>(1)</sup> Status: For more details on status, see our product life cycle.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

<sup>(2)</sup> Material type: When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

<sup>(3)</sup> RoHS values: Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

<sup>(4)</sup> Lead finish/Ball material: Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

<sup>(5)</sup> MSL rating/Peak reflow: The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

<sup>(6)</sup> Part marking: There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.
