

ISO124 ± 10 -V Input, Precision Isolation Amplifier

1 Features

- 100% Tested for High-Voltage Breakdown
- Rated 1500 Vrms
- High IMR: 140 dB at 60 Hz
- Maximum Nonlinearity: 0.010%
- Bipolar Operation: $V_O = \pm 10$ V
- Packages: PDIP-16 and SOIC-28
- Ease of Use: Fixed Unity Gain Configuration
- Supply Range: ± 4.5 -V to ± 18 -V

2 Applications

- Industrial Process Control:
 - Transducer Isolator, Isolator for Thermocouples, RTDs, Pressure Bridges, and Flow Meters, 4-mA to 20-mA Loop Isolation
- Ground Loop Elimination
- Motor and SCR Control
- Power Monitoring
- PC-Based Data Acquisition
- Test Equipment

3 Description

The ISO124 is a precision isolation amplifier incorporating a novel duty cycle modulation-demodulation technique. The signal is transmitted digitally across a 2-pF differential capacitive barrier. With digital modulation, the barrier characteristics do not affect signal integrity, thus resulting in excellent reliability and good high-frequency transient immunity across the barrier. Both barrier capacitors are imbedded in the plastic body of the package.

The ISO124 is easy to use. No external components are required for operation. The key specifications are 0.010% maximum nonlinearity, 50-kHz signal bandwidth, and $200\text{-}\mu\text{V}/^\circ\text{C}$ V_{OS} drift. A power supply range of ± 4.5 V to ± 18 V, and quiescent currents of ± 5 mA on V_{S1} and ± 5.5 mA on V_{S2} make the ISO124 device a good choice for a wide range of applications.

The ISO124 is available in 16-pin PDIP and 28-lead SOIC plastic surface-mount packages.

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
ISO124	PDIP (16)	17.90 mm $\times$ 7.50 mm
	SOIC (28)	20.01 mm $\times$ 6.61 mm

(1) For all available packages, see the package option addendum at the end of the data sheet.

4 Revision History

Changes from Revision D (July 2016) to Revision E

	Page
• Changed 16-pin SOIC package to 16-pin PDIP package to match content shown in package option addendum at the end of the data sheet	1
• Changed DVA and NVF pin configuration labels to match content shown in the package option addendum at the end of the data sheet	3
• Changed parameter name from "vs temperature" to "Input offset drift" in <i>Electrical Characteristics</i> table	5
• Changed parameter name from "vs power supply" to "Power-supply rejection ratio" in <i>Electrical Characteristics</i> table	5
• Changed location of supply voltage specifications from the <i>Electrical Characteristics</i> table to the <i>Recommended Operating Conditions</i> table	5
• Changed parameter name from "Quiescent current" to "High-side analog supply current", and changed symbol from "V _{S1} " to "I _{VS1} " in <i>Electrical Characteristics</i> table	5
• Changed parameter name from "Quiescent current" to "Low-side analog supply current", and changed symbol from "V _{S2} " to "I _{VS2} " in <i>Electrical Characteristics</i> table	5
• Changed location of Temperature specifications from the <i>Electrical Characteristics</i> table to the <i>Recommended Operating Conditions</i> table	5
• Deleted Thermal resistance parameters from <i>Electrical Characteristics</i> table; see <i>Thermal Information</i> table	5

Changes from Revision C (September 2005) to Revision D

	Page
• Added <i>ESD Ratings</i> table, <i>Feature Description</i> section, <i>Device Functional Modes</i> , <i>Application and Implementation</i> section, <i>Power Supply Recommendations</i> section, <i>Layout</i> section, <i>Device and Documentation Support</i> section, and <i>Mechanical, Packaging, and Orderable Information</i> section.	1

5 Pin Configuration and Functions

Pin Functions

PIN			I/O	DESCRIPTION
NAME	PDIP	SOIC		
Gnd 1	16	28	—	High-side ground reference

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) ⁽¹⁾

	MIN	MAX	UNIT
Supply voltage		±18	V
Analog input voltage, V_{IN}		100	V
Continuous isolation voltage		1500	V _{rms}
Junction temperature		125	°C
Output short to common		Continuous	
Storage temperature, T_{stg}	–40	125	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

		VALUE	UNIT
$V_{(ESD)}$ Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±1000	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

	MIN	NOM	MAX	UNIT
V_{S1} High-side analog supply voltage ($\pm V_{S1}$ to GND1)	±4.5	±15	±18	V
V_{S2} Low-side analog supply voltage ($\pm V_{S2}$ to GND2)	±4.5	±15	±18	V
V_{IN} Analog input voltage		±10		V
T_A Operating temperature	–25		85	°C

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		ISO124		UNIT
		DVA (SOIC)	NVF (PDIP)	
		28 PINS	16 PINS	
$R_{\theta JA}$ Junction-to-ambient thermal resistance		79.8	51.0	°C/W
$R_{\theta JC(top)}$ Junction-to-case (top) thermal resistance		32.9	32.4	°C/W
$R_{\theta JB}$ Junction-to-board thermal resistance		42.2	29.5	°C/W
Ψ_{JT} Junction-to-top characterization parameter		6.6	10.4	°C/W

Figure 9. Signal Response to Inputs Greater than 250 kHz

7 Detailed Description

7.1 Overview

The ISO124 isolation amplifier uses an input and an output section galvanically isolated by matched 1-pF isolating capacitors built into the plastic package. The input is duty-cycle modulated and transmitted digitally across the barrier. The output section receives the modulated signal, converts it back to an analog voltage and removes the ripple component inherent in the demodulation. Input and output sections are fabricated, then laser trimmed for exceptional circuitry matching common to input and output sections. The sections are then mounted on opposite ends of the package with the isolating capacitors mounted between the two sections. The ISO124 contains 250 transistors.

7.1.1 Modulator

An input amplifier (A1, as shown in [Functional Block Diagram](#)) integrates the difference between the input current ($V_{IN}/200\text{ k}\Omega$) and a switched $\pm 100\text{-}\mu\text{A}$ current source. This current source is implemented by a switchable $200\text{-}\mu\text{A}$ source and a fixed $100\text{-}\mu\text{A}$ current sink. To understand the basic operation of the modulator, assume that $V_{IN} = 0\text{ V}$. The integrator will ramp in one direction until the comparator threshold is exceeded. The comparator and sense amp will force the current source to switch; the resultant signal is a triangular waveform with a 50% duty cycle. The internal oscillator forces the current source to switch at 500 kHz. The resultant capacitor drive is a complementary duty-cycle modulation square wave.

7.1.2 Demodulator

The sense amplifier detects the signal transitions across the capacitive barrier and drives a switched current source into integrator A2. The output stage balances the duty-cycle modulated current against the feedback current through the $200\text{-k}\Omega$ feedback resistor, resulting in an average value at the V_{OUT} pin equal to V_{IN} . The sample-and-hold amplifiers in the output feedback loop serve to remove undesired ripple voltages inherent in the demodulation process.

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

8.1.1 Carrier Frequency Considerations

The ISO124 amplifier transmits the signal across the isolation barrier by a 500-kHz duty-cycle modulation technique. For input signals having frequencies below 250 kHz, this system works like any linear amplifier. But for frequencies above 250 kHz, the behavior is similar to that of a sampling amplifier. [Figure 9](#) shows this behavior graphically; at input frequencies above 250 kHz, the device generates an output signal component of reduced magnitude at a frequency below 250 kHz. This is the aliasing effect of sampling at frequencies less than two times the signal frequency (the Nyquist frequency). At the carrier frequency and its harmonics, both the frequency and amplitude of the aliasing go to zero.

8.1.2 Isolation Mode Voltage Induced Errors

IMV can induce errors at the output as indicated by the plots of IMV vs Frequency. It should be noted that if the IMV frequency exceeds 250 kHz, the output also will display spurious outputs (aliasing) in a manner similar to that for $V_{IN} > 250$ kHz and the amplifier response will be identical to that shown in [Figure 9](#). This occurs because IMV-induced errors behave like input-referred error signals. To predict the total error, divide the isolation voltage by the IMR shown in [Figure 11](#) and compute the amplifier response to this input-referred error signal from the data shown in [Figure 9](#). For example, if a 800-kHz 1000-Vrms IMR is present, then a total of $[(-60 \text{ dB}) + (-30 \text{ dB})] \times (1000 \text{ V}) = 32\text{-mV}$ error signal at 200 kHz plus a 1-V, 800-kHz error signal will be present at the output.

8.1.3 High IMV dV/dt Errors

As the IMV frequency increases and the dV/dt exceeds 1000 V/ μ s, the sense amp may start to false trigger, and the output will display spurious errors. The common-mode current being sent across the barrier by the high slew rate is the cause of the false triggering of the sense amplifier. Lowering the power-supply voltages below ± 15 V may decrease the dV/dt to 500 V/Ms for typical performance.

8.1.4 High Voltage Testing

TI has adopted a partial discharge test criterion that conforms to the German VDE0884 Optocoupler Standards. This method requires the measurement of minute current pulses (< 5 pC) while applying 2400-Vrms, 60-Hz high-voltage stress across every ISO124 isolation barrier. No partial discharge may be initiated to pass this test. This criterion confirms transient overvoltage (1.6×1500 Vrms) protection without damage to the ISO124. Lifetest results verify the absence of failure under continuous rated voltage and maximum temperature.

This new test method represents the “state-of-the art” for nondestructive high-voltage reliability testing. It is based on the effects of nonuniform fields that exist in heterogeneous dielectric material during barrier degradation. In the case of void nonuniformities, electric field stress begins to ionize the void region before bridging the entire high-voltage barrier. The transient conduction of charge during and after the ionization can be detected externally as a burst of 0.01–0.1- μ s current pulses that repeat on each ac voltage cycle. The minimum ac barrier voltage that initiates partial discharge is defined as the “inception voltage.” Decreasing the barrier voltage to a lower level is required before partial discharge ceases and is defined as the “extinction voltage.” The package insulation processes have been characterized and developed to yield an inception voltage in excess of 2400 Vrms so that transient overvoltages below this level will not damage the ISO124. The extinction voltage is above 1500 Vrms so that even overvoltage induced partial discharge will cease once the barrier voltage is reduced to the 1500-Vrms (rated) level. Older high-voltage test methods relied on applying a large enough overvoltage (above rating) to break down marginal parts, but not so high as to damage good ones. Our new partial discharge testing gives us more confidence in barrier reliability than breakdown/no breakdown criteria.

8.2 Typical Applications

8.2.1 Output Filters

For more information concerning output filters, see [Simple Output Filter Eliminates ISO Amp Output Ripple and Keeps Full Bandwidth](#) and [FilterPro™ MFB and Sallen-Key Low-Pass Filter Design Program User Guide](#).

Figure 10. ISO124 With Output Filter for Improved Ripple

8.2.1.1 Design Requirements

The ISO124 isolation amplifiers (ISO amps) have a small (10 to 20 mVp-p typical) residual demodulator ripple at the output. A simple filter can be added to eliminate the output ripple without decreasing the 50kHz signal bandwidth of the ISO amp.

8.2.1.2 Detailed Design Procedure

The ISO124 device is designed to have a 50-kHz single-pole (Butterworth) signal response. By cascading the ISO amp with a simple 50-kHz, $Q = 1$, two-pole, low-pass filter, the overall signal response becomes three-pole Butterworth. The result is a maximally flat 50-kHz magnitude response and the output ripple reduced below the noise level. [Figure 10](#) shows the complete circuit. The two-pole filter is a unity-gain Sallen-Key type consisting of A1, R1, R2, C1, and C2. The values shown give $Q = 1$ and f_{-3dB} bandwidth = 50 kHz. Because the op amp is connected as a unity-gain follower, gain and gain accuracy of the ISO amp are unaffected. Using a precision op amp such as the OPA602 also preserves the DC accuracy of the ISO amp.

Typical Applications (continued)

8.2.1.3 Application Curves

- 1) Standard ISO124 has 50kHz single-pole (Butterworth) response.
- 2) ISO124 with cascaded 50kHz, $Q = 1$, two-pole, low-pass filter has three-pole Butterworth response.

Figure 11. Gain vs. Frequency

Typical Applications (continued)

8.2.2 Battery Monitor

Figure 17 provides a means to monitor the cell voltage on a 600-V battery stack by using the battery as a power source for the isolated voltage.

Figure 17. Battery Monitor for a 600-V Battery Power System

Typical Applications (continued)

8.2.3 Programmable Gain Amplifier

In applications where variable gain configurations are required, a programmable gain amplifier like the PGA102 can be used with the ISO124 device. Figure 18 uses an ISO150 device to provide gain pin selection options to the PGA102 device.

Figure 18. Programmable-Gain Isolation Channel With Gains of 1, 10, and 100

Typical Applications (continued)

8.2.4 Thermocouple Amplifier

For isolated temperature measurements, Figure 19 provides an application solution using the INA114 or INA128 devices, feeding the input stage of the ISO124 device. The table provides suggested resistor values based on the type of thermistor used in the application.

Figure 19. Thermocouple Amplifier With Ground Loop Elimination, Cold Junction Compensation, and Up-scale Burn-out

Typical Applications (continued)

8.2.5 Isolated 4-mA to 20-mA Instrument Loop

For isolated temperature measurements in a 4-mA to 20-mA loop, [Figure 20](#) provides a solution using the XTR101 and RCV420 devices. A high-performance PT100 resistance temperature detector (RTD) provides the user with an isolated 0-V to 5-V representation of the isolated temperature measurement.

Figure 20. Isolated 4- to 20-mA Instrument Loop (RTD Shown)

8.2.6 Single-Supply Operation of the ISO124 Isolation Amplifier

The circuit shown in [Figure 21](#) uses a 5.1-V Zener diode to generate the negative supply for an ISO12x from a single supply on the high-voltage side of the isolation amplifier. The input measuring range will be dependent on the applied voltage as noted in the accompanying table.

NOTE: Because the amplifier is unity gain, the input range is also the output range. The output can go to -2 V because the output section of the ISO amp operates from dual supplies.

For additional information see [Single-Supply Operation of Isolation Amplifiers](#).

Figure 21. Single-Supply Operation of the ISO124 Isolation Amplifier Schematic

Typical Applications (continued)

8.2.7 Input-Side Powered ISO Amplifier

The user side of the ISO124 device can be powered from the high voltage side using an isolated DC-DC converter as shown in [Figure 22](#).

Figure 22. Input-Side Powered ISO Amplifier Schematic

Typical Applications (continued)

8.2.8 Powered ISO Amplifier With Three-Port Isolation

Figure 23 illustrates an application solution that provides isolated power to both the user and high-voltage sides of the ISO124 amplifier.

Figure 23. Powered ISO Amplifier With Three-Port Isolation Schematic

9 Power Supply Recommendations

9.1 Signal and Supply Connections

Each power-supply pin should be bypassed with 1- μ F tantalum capacitors located as close to the amplifier as possible. The internal frequency of the modulator/demodulator is set at 500 kHz by an internal oscillator. Therefore, if it is desired to minimize any feedthrough noise (beat frequencies) from a DC-DC converter, use a π filter on the supplies (see [Figure 10](#)). The ISO124 output has a 500-kHz ripple of 20 mV, which can be removed with a simple 2-pole low-pass filter with a 100-kHz cutoff using a low-cost op amp (see [Figure 10](#)).

The input to the modulator is a current (set by the 200-k Ω integrator input resistor) that makes it possible to have an input voltage greater than the input supplies, as long as the output supply is at least ± 15 V. It is therefore possible, when using an unregulated DC-DC converter, to minimize PSR related output errors with ± 5 -V voltage regulators on the isolated side and still get the full ± 10 -V input and output swing.

Figure 24. Basic Signal and Power Connections

10 Layout

10.1 Layout Guidelines

To maintain the isolation barrier of the device, the distance between the high-side ground (pin 16 or 28) and the low-side ground (pin 8 or 14) should be kept at maximum; that is, the entire area underneath the device should be kept free of any conducting materials.

10.2 Layout Example

Figure 25. ISO124 Layout Example

11.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) Part marking: There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TUBE

*All dimensions are nominal

Device	Package Name	Package Type	Pins	SPQ	L (mm)	W (mm)	T (μm)	B (mm)
ISO124P	NVF	PDIP	8	25	506	13.97	11230	4.32
ISO124P.A	NVF	PDIP	8	25	506	13.97	11230	4.32
ISO124U	DVA	SOIC	8	20	507	12.83	5080	6.6
ISO124U.A	DVA	SOIC	8	20	507	12.83	5080	6.6
ISO124UE4	DVA	SOIC	8	20	507	12.83	5080	6.6

PLASTIC SMALL-OUTLINE

- I. Falls within JEDEC MS-013-AE with the exception of the number of leads.

NVF (R-PDIP-T8/16)

PLASTIC DUAL-IN-LINE

- A. All linear dimensions are in inches (millimeters).
 B. This drawing is subject to change without notice.
 C. Falls within JEDEC MS-001-BB with the exception of lead count.

D. Dimensions do not include mold flash or protrusions.
 Mold flash or protrusions shall not exceed 0.010 (0,25).

E. Dimensions measured with the leads constrained to be perpendicular to Datum C.

F. Dimensions are measured at the lead tips with the leads unconstrained.

- G. A visual index feature must be located within the cross-hatched area.

IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATA SHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES "AS IS" AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for skilled developers designing with TI products. You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, regulatory or other requirements.

These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource. Other reproduction and display of these resources is prohibited. No license is granted to any other TI intellectual property right or to any third party intellectual property right. TI disclaims responsibility for, and you will fully indemnify TI and its representatives against, any claims, damages, costs, losses, and liabilities arising out of your use of these resources.

TI's products are provided subject to [TI's Terms of Sale](#) or other applicable terms available either on [ti.com](https://www.ti.com) or provided in conjunction with such TI products. TI's provision of these resources does not expand or otherwise alter TI's applicable warranties or warranty disclaimers for TI products.

TI objects to and rejects any additional or different terms you may have proposed.
