MSP430FR2433 Mixed-Signal Microcontroller

1 Device Overview

1.1 Features

- Embedded microcontroller
  - 16-bit RISC architecture
  - Clock supports frequencies up to 16 MHz
  - Wide supply voltage range from 3.6 V down to 1.8 V (minimum supply voltage is restricted by SVS levels, see the SVS specifications)
- Optimized ultra-low-power modes
  - Active mode: 126 µA/MHz (typical)
  - Standby: <1 µA with VLO
  - LPM3.5 real-time clock (RTC) counter with 32768-Hz crystal: 730 nA (typical)
  - Shutdown (LPM4.5): 16 nA (typical)
- High-performance analog
  - 8-channel 10-bit analog-to-digital converter (ADC)
    - Internal 1.5-V reference
    - Sample-and-hold 200 ksps
- Enhanced serial communications
  - Two enhanced universal serial communication interfaces (eUSCI_A) support UART, IrDA, and SPI
  - One eUSCI (eUSCI_B) supports SPI and I^2C
- Intelligent digital peripherals
  - Four 16-bit timers
    - Two timers with three capture/compare registers each (Timer_A3)
    - Two timers with two capture/compare registers each (Timer_A2)
  - One 16-bit counter-only RTC
  - 16-bit cyclic redundancy check (CRC)
- Low-power ferroelectric RAM (FRAM)
  - Up to 15.5KB of nonvolatile memory
  - Built-in error correction code (ECC)
  - Configurable write protection
  - Unified memory of program, constants, and storage
  - 10^{15} write cycle endurance
  - Radiation resistant and nonmagnetic
  - High FRAM-to-SRAM ratio, up to 4:1
- Clock system (CS)
  - On-chip 32-kHz RC oscillator (REFO)
  - On-chip 16-MHz digitally controlled oscillator (DCO) with frequency-locked loop (FLL)
    - ±1% accuracy with on-chip reference at room temperature
  - On-chip very low-frequency 10-kHz oscillator (VLO)
  - On-chip high-frequency modulation oscillator (MODOSC)
  - External 32-kHz crystal oscillator (LFXT)
  - Programmable MCLK prescalar of 1 to 128
  - SMCLK derived from MCLK with programmable prescalar of 1, 2, 4, or 8
- General input/output and pin functionality
  - Total of 19 I/Os on VQFN-24 package
  - 16 interrupt pins (P1 and P2) can wake MCU from low-power modes
- Development tools and software
  - Development tools
    - LaunchPad™ development kit (MSP-EXP430FR2433)
    - Target development board (MSP-TS430RGE24A)
- Family member (also see Device Comparison)
  - MSP430FR2433: 15KB of program FRAM, 512B of information FRAM, 4KB of RAM
- Package options
  - 24 pin: VQFN (RGE)
  - 24-pin: DSBGA (YQW)

1.2 Applications

- Small form factor industrial sensors
- Low-power medical, health, and fitness
- Electronic door locks
- Energy harvesting

1.3 Description

The MSP430FR2433 microcontroller (MCU) is part of the MSP430™ Value Line sensing portfolio, TI's lowest-cost family of MCUs for sensing and measurement applications. The architecture, FRAM, and integrated peripherals, combined with extensive low-power modes, are optimized to achieve extended battery life in portable and battery-powered sensing applications in a small VQFN package (4 mm × 4 mm).

TI's MSP430 ultra-low-power FRAM microcontroller platform combines uniquely embedded FRAM and a holistic ultra-low-power system architecture, allowing system designers to increase performance while lowering energy consumption. FRAM technology combines the low-energy fast writes, flexibility, and endurance of RAM with the nonvolatility of flash.

The MSP430FR2433 MCU is supported by an extensive hardware and software ecosystem with reference designs and code examples to get your design started quickly. Development kits include the MSP-EXP430FR2433 LaunchPad™ development kit and the MSP-TS430RGE24A 24-pin target development board. TI also provides free MSP430Ware™ software, which is available as a component of Code Composer Studio™ IDE desktop and cloud versions within TI Resource Explorer. The MSP430 MCUs are also supported by extensive online collateral, training, and online support through the E2E™ support forums.

For complete module descriptions, see the *MSP430FR4xx and MSP430FR2xx Family User's Guide*.

Device Information(1)

PART NUMBER	PACKAGE	BODY SIZE(2)
MSP430FR2433IRGE	VQFN (24)	4 mm × 4 mm
MSP430FR2433IYQW	DSBGA (24)	2.29 mm × 2.34 mm

(1) For the most current part, package, and ordering information, see the *Package Option Addendum* in Section 9, or see the TI website at www.ti.com.
(2) The sizes shown here are approximations. For the package dimensions with tolerances, see the *Mechanical Data* in Section 9.

CAUTION

System-level ESD protection must be applied in compliance with the device-level ESD specification to prevent electrical overstress or disturbing of data or code memory. See *MSP430 System-Level ESD Considerations* for more information.

1.4 Functional Block Diagram

Figure 1-1 shows the functional block diagram.

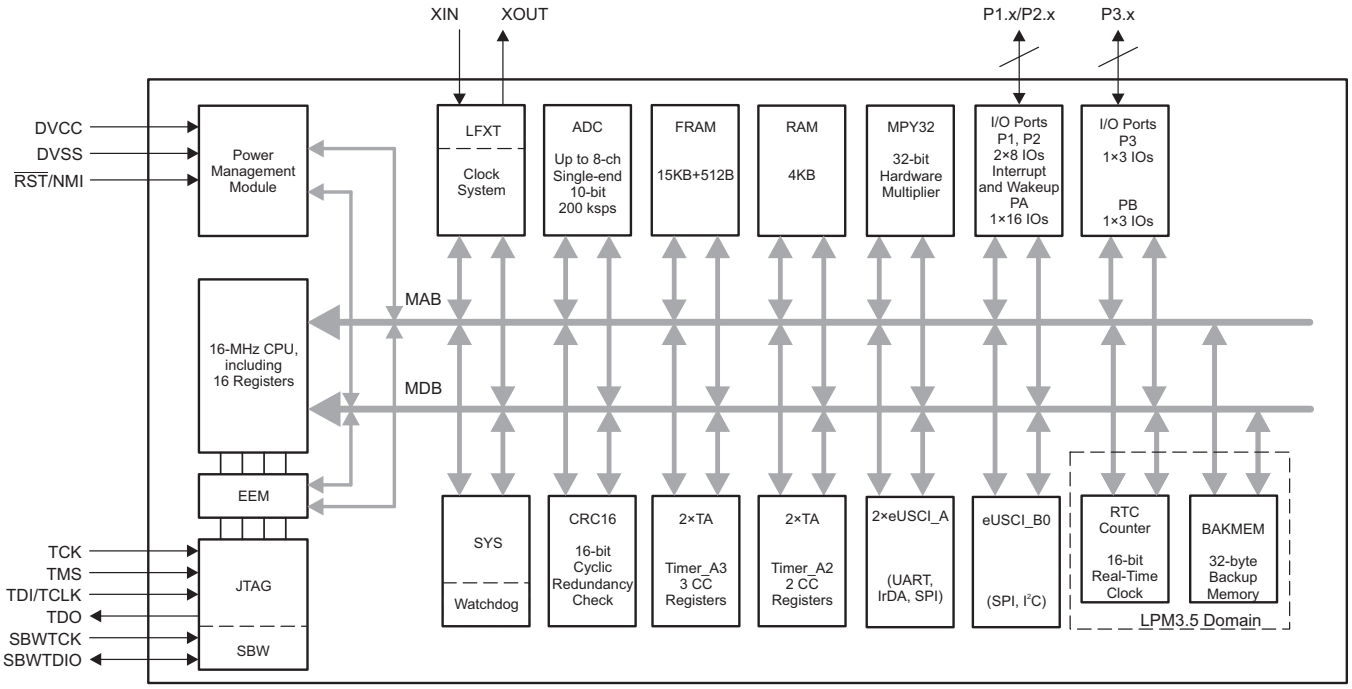

Figure 1-1. Functional Block Diagram

- The MCU has one main power pair of DVCC and DVSS that supplies digital and analog modules. Recommended bypass and decoupling capacitors are 4.7 µF to 10 µF and 0.1 µF, respectively, with ±5% accuracy.
- P1 and P2 feature the pin interrupt function and can wake up the MCU from all LPMs, including LPM3.5 and LPM4.
- Each Timer_A3 has three capture/compare registers, but only CCR1 and CCR2 are externally connected. CCR0 registers can be used only for internal period timing and interrupt generation.
- Each Timer_A2 has two capture/compare registers, but only CCR1 is a compare/capture functionality. CCR0 registers can be used only for internal period timing and interrupt generation.
- In LPM3.5, the RTC module can be functional while the rest of the peripherals are off.

2 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from revision E to revision F

Changes from August 20, 2019 to December 9, 2019	Page
• Changed the note that begins "Supply voltage changes faster than 0.2 V/µs can trigger a BOR reset..." in Section 5.3, *Recommended Operating Conditions*	16
• Added the note that begins "TI recommends that power to the DVCC pin must not exceed the limits..." in Section 5.3, *Recommended Operating Conditions*	16
• Changed the note that begins "A capacitor tolerance of ±20% or better is required..." in Section 5.3, *Recommended Operating Conditions*	16
• Changed the note that begins "Requires external capacitors at both terminals..." in Table 5-4, *XT1 Crystal Oscillator (Low Frequency)*	23
• Added the $t_{(int)}$ parameter in Table 5-10, *Digital Inputs*	27
• Added the $t_{TA,cap}$ parameter in Table 5-13, *Timer_A*	29
• Corrected the test conditions for the $R_{I,MUX}$ parameter in Table 5-20, *ADC, Power Supply and Input Range Conditions*	35
• Added the note that begins "$t_{Sample} = \ln(2^{n+1}) \times \tau$ ..." in Table 5-21, *ADC, 10-Bit Timing Parameters*	35
• Changed the CRC covered end address to 0x1AF5 in note (1) in Table 6-22, *Device Descriptors*	60

Changes from revision D to revision E

Changes from September 11, 2018 to August 19, 2019	Page
• Added the $t_{TA,cap}$ parameter in Table 5-13, *Timer_A*	29
• Changed the parameter symbol from R_I to $R_{I,MUX}$ in Table 5-20 , *ADC, Power Supply and Input Range Conditions*	35
• Added $R_{I,Misc}$ TYP value of 34 kΩ in Table 5-20 , *ADC, Power Supply and Input Range Conditions*	35
• Added formula for R_I calculation in Table 5-21 , *ADC, 10-Bit Timing Parameters*	35
• Removed the description of "±3°C" in table note that starts "The device descriptor structure ..." of Table 5-22, *ADC, 10-Bit Linearity Parameters*	36
• Corrected bitfield from IRDSEL to IRDSSEL in Section 6.10.8, *Timers (Timer0_A3, Timer1_A3, Timer2_A2 and Timer3_A2)*, in the description that starts "The interconnection of Timer0_A3 and ..."	51
• Corrected the ADCINCHx column heading in Table 6-15, *ADC Channel Connections*	53
• Corrected the ADCSHSx column heading in Table 6-16, *ADC Trigger Signal Connections*	53
• Added P1SELC information in Table 6-32, *Port P1, P2 Registers (Base Address: 0200h)*	64
• Added P2SELC information in Table 6-32, *Port P1, P2 Registers (Base Address: 0200h)*	64
• Added P3SELC information in Table 6-33, *Port P3 Registers (Base Address: 0220h)*	64

Changes from revision C to revision D

Changes from August 29, 2018 to September 10, 2018	Page
• Removed SYNC signal (not supported) from Figure 4-1, *32-Pin RHB Package (Top View)*	8
• Combined two YQW pinout figures into one, and removed SYNC signal (not supported) in Figure 4-2, *24-Pin YQW Package (Top and Bottom Views)*	9
• Added the $t_{TA,cap}$ parameter in Table 5-13, *Timer_A*	29
• Removed SYNC signal (not supported) from figure and table in Section 6.11.2, *Port P2 (P2.0 to P2.2) Input/Output With Schmitt Trigger*	56

Changes from revision B to revision C

Changes from June 20, 2017 to August 28, 2018	Page
• Updated Section 3.1, *Related Products*	7

- Corrected description of pin C5 on YQW package (changed from DVSS to NC) in Table 4-1, *Pin Attributes* 11
- Corrected typos in the pin numbers of P2.3,5,6 in the RGE package in Table 4-2 13
- Corrected typos in the pin numbers of UCA1RXD and UCA1TXD in the RGE package in Table 4-2 14
- Changed description of NC pins from "No internal connection" to "No connection" in Table 4-2, *Signal Descriptions* 14
- Corrected package type in VQFN row (changed from QFN to VQFN) in Table 4-2, *Signal Descriptions* 14
- Changed HBM limit to ±1000 V and CDM limit to ±250 V in Section 5.2, *ESD Ratings* 16
- Added note to V_{SVSH-} and V_{SVSH+} parameters in Table 5-2, *PMM, SVS and BOR* 21
- Added the $t_{TA,cap}$ parameter in Table 5-13, *Timer_A* 29
- Moved "FRAM access time error" to "System Reset" row and added ACCTEIFG to interrupt flag column in Table 6-2, *Interrupt Sources, Flags, and Vectors* 41
- Corrected the offset for P2SEL1 in Table 6-32, *Port P1, P2 Registers (Base Address: 0200h)* 64
- Updated text and figure in Section 8.2, *Device Nomenclature* 75

Changes from revision A to revision B

Changes from June 9, 2017 to June 19, 2017 **Page**

- Corrected FRAM and RAM sizes in Figure 1-1, *Functional Block Diagram* 3
- Added the $t_{TA,cap}$ parameter in Table 5-13, *Timer_A* 29

Changes from initial release to revision A

Changes from October 21, 2015 to June 8, 2017 **Page**

- Added note to list item that starts "Wide Supply Voltage Range..." 1
- Added DSBGA (YQW) package to "Package Options" list in Section 1.1, *Features* 1
- Added DSBGA (YQW) package option to *Device Information* table in Section 1.3, *Description* 2
- Added row for MSP430FR2433IYQW to Table 3-1, *Device Comparison* 7
- Added Section 3.1, *Related Products* 7
- Added DSBGA (YQW) package to Table 4-1, *Pin Attributes* 10
- Added DSBGA (YQW) package to Table 4-2, *Signal Descriptions* 12
- Added row for VQFN thermal pad 14
- Removed FRAM reflow note 16
- In the note that starts "Low-power mode 3, VLO, excludes SVS test conditions...", changed "f_{XT1} = 0 Hz" to "f_{XT1} = 32768 Hz" 18
- Added DSBGA (YQW) package and changed notes for Section 5.10, *Thermal Resistance Characteristics* 20
- Added note that starts "The VLO clock frequency is reduced by 15%..." 26
- Added the $t_{TA,cap}$ parameter in Table 5-13, *Timer_A* 29
- Removed ADCDIV from the formula for the TYP value in the second row of the $t_{CONVERT}$ parameter in Table 5-21, *ADC, 10-Bit Timing Parameters* (removed because ADCCLK is after division) 35
- Added note to "Clock" in Table 6-1, *Operating Modes* 40
- Added note that starts "XT1CLK and VLOCLK can be active during LPM4..." 41
- Add description of blank device detection 43
- Corrected description in Section 6.10.10, *Backup Memory (BKMEM)* 52
- Changed the paragraph that starts "Quickly switching digital signals and ..." in Section 7.2.1.2, *Design Requirements* 73
- Updated Figure 8-1, *Device Nomenclature* 75
- Replaced former section *Development Tools Support* with Section 8.3, *Tools and Software* 76
- Updated format and content of Section 8.4, *Documentation Support* 78

4.4 Pin Multiplexing

Pin multiplexing for these MCUs is controlled by both register settings and operating modes (for example, if the MCU is in test mode). For details of the settings for each pin and schematics of the multiplexed ports, see Section 6.11.

4.5 Buffer Types

Table 4-3 defines the pin buffer types that are listed in Table 4-1.

Table 4-3. Buffer Types

BUFFER TYPE (STANDARD)	NOMINAL VOLTAGE	HYSTERESIS	PU OR PD	NOMINAL PU OR PD STRENGTH (µA)	OUTPUT DRIVE STRENGTH (mA)	OTHER CHARACTERISTICS
LVCMOS	3.0 V	Y(1)	Programmable	See Section 5.11.4	See Section 5.11.4	
Analog	3.0 V	N	N/A	N/A	N/A	See analog modules in Section 5 for details.
Power (DVCC)	3.0 V	N	N/A	N/A	N/A	SVS enables hysteresis on DVCC.
Power (AVCC)	3.0 V	N	N/A	N/A	N/A	

(1) Only for input pins.

4.6 Connection of Unused Pins

Table 4-4 lists the correct termination of unused pins.

Table 4-4. Connection of Unused Pins(1)

PIN	POTENTIAL	COMMENT
Px.0 to Px.7	Open	Switched to port function, output direction (PxDIR.n = 1)
$\overline{\text{RST}}$/NMI	DV_{CC}	47-kΩ pullup or internal pullup selected with 10-nF (or 1.1-nF) pulldown(2)
TEST	Open	This pin always has an internal pulldown enabled.

(1) Any unused pin with a secondary function that is shared with general-purpose I/O should follow the Px.0 to Px.7 unused pin connection guidelines.
(2) The pulldown capacitor should not exceed 1.1 nF when using MCUs with Spy-Bi-Wire interface in Spy-Bi-Wire mode with TI tools like FET interfaces or GANG programmers.

5 Specifications

5.1 Absolute Maximum Ratings(1)

over operating free-air temperature range (unless otherwise noted)

	MIN	MAX	UNIT
Voltage applied at DVCC pin to V_{SS}	–0.3	4.1	V
Voltage applied to any other pin(2)	–0.3	V_{CC} + 0.3 (4.1 V Max)	V
Diode current at any device pin		±2	mA
Maximum junction temperature, T_J		85	°C
Storage temperature, T_{stg}(3)	–40	125	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) All voltages referenced to V_{SS}.
(3) Higher temperature may be applied during board soldering according to the current JEDEC J-STD-020 specification with peak reflow temperatures not higher than classified on the device label on the shipping boxes or reels.

5.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001(1)	±1000	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101(2)	±250	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. Pins listed as ±1000 V may actually have higher performance.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process. Pins listed as ±250 V may actually have higher performance.

5.3 Recommended Operating Conditions

			MIN	NOM	MAX	UNIT
V_{CC}	Supply voltage applied at DVCC pin(1)(2)(3)(4)		1.8		3.6	V
V_{SS}	Supply voltage applied at DVSS pin			0		V
T_A	Operating free-air temperature		–40		85	°C
T_J	Operating junction temperature		–40		85	°C
C_{DVCC}	Recommended capacitor at DVCC(5)		4.7	10		µF
f_{SYSTEM}	Processor frequency (maximum MCLK frequency)(6)	No FRAM wait states (NWAITSx = 0)	0		8	MHz
		With FRAM wait states (NWAITSx = 1)(7)	0		16(8)	
f_{ACLK}	Maximum ACLK frequency				40	kHz
f_{SMCLK}	Maximum SMCLK frequency				16(8)	MHz

(1) Supply voltage changes faster than 0.2 V/µs can trigger a BOR reset even within the recommended supply voltage range. Following the data sheet recommendation for capacitor C_{DVCC} limits the slopes accordingly.
(2) Modules may have a different supply voltage range specification. See the specification of the respective module in this data sheet.
(3) TI recommends that power to the DVCC pin must not exceed the limits specified in *Recommended Operating Conditions*. Exceeding the specified limits can cause malfunction of the device including erroneous writes to RAM and FRAM.
(4) The minimum supply voltage is defined by the SVS levels. See the SVS threshold parameters in Table 5-2.
(5) A capacitor tolerance of ±20% or better is required. A low-ESR ceramic capacitor of 100 nF (minimum) should be placed as close as possible (within a few millimeters) to the respective pin pair.
(6) Modules may have a different maximum input clock specification. See the specification of the respective module in this data sheet.
(7) Wait states only occur on actual FRAM accesses (that is, on FRAM cache misses). RAM and peripheral accesses are always executed without wait states.
(8) If clock sources such as HF crystals or the DCO with frequencies >16 MHz are used, the clock must be divided in the clock system to comply with this operating condition.

5.4 Active Mode Supply Current Into V_{CC} Excluding External Current(1)

V_{CC} = 3 V, T_A = 25°C (unless otherwise noted)

PARAMETER	EXECUTION MEMORY	TEST CONDITION	FREQUENCY (f_{MCLK} = f_{SMCLK})						UNIT
			1 MHz 0 WAIT STATES (NWAITSx = 0)		8 MHz 0 WAIT STATES (NWAITSx = 0)		16 MHz 1 WAIT STATE (NWAITSx = 1)		
			TYP	MAX	TYP	MAX	TYP	MAX	
$I_{AM,\ FRAM}$(0%)	FRAM 0% cache hit ratio	3 V, 25°C	504		2772		3047	3480	µA

$I_{AM,\ FRAM}$(100%)	FRAM 100% cache hit ratio	3 V, 25°C	203		625		1000	1215	µA
		3 V, 85°C	212		639		1016		
$I_{AM,\ RAM}$(2)	RAM	3 V, 25°C	229		818		1377		µA

(1) All inputs are tied to 0 V or to V_{CC}. Outputs do not source or sink any current. Characterized with program executing typical data processing.
f_{ACLK} = 32768 Hz, f_{MCLK} = f_{SMCLK} = f_{DCO} at specified frequency
Program and data entirely reside in FRAM. All execution is from FRAM.
(2) Program and data reside entirely in RAM. All execution is from RAM. No access to FRAM.

5.5 Active Mode Supply Current Per MHz

V_{CC} = 3 V, T_A = 25°C (unless otherwise noted)

PARAMETER		TEST CONDITIONS	TYP	UNIT
$dI_{AM,FRAM}/df$	Active mode current consumption per MHz, execution from FRAM, no wait states	[I_{AM} (75% cache hit rate) at 8 MHz – I_{AM} (75% cache hit rate) at 1 MHz)] / 7 MHz	126	µA/MHz

5.6 Low-Power Mode LPM0 Supply Currents Into V_{CC} Excluding External Current

V_{CC} = 3 V, T_A = 25°C (unless otherwise noted)(1)(2)

PARAMETER	V_{CC}	FREQUENCY (f_{SMCLK})						UNIT
		1 MHz		8 MHz		16 MHz		
		TYP	MAX	TYP	MAX	TYP	MAX	
I_{LPM0}	2 V	156		328		420		µA
	3 V	166		342		433		

(1) All inputs are tied to 0 V or to V_{CC}. Outputs do not source or sink any current.
(2) Current for watchdog timer clocked by SMCLK included.
f_{ACLK} = 32768 Hz, f_{MCLK} = 0 MHz, f_{SMCLK} at specified frequency.

5.7 Low-Power Mode (LPM3 and LPM4) Supply Currents (Into V_{CC}) Excluding External Current

		2 V	0.34		0.48		2.46		

(1) All inputs are tied to 0 V or to V_{CC}. Outputs do not source or sink any current.
(2) Not applicable for MCUs with HF crystal oscillator only.
(3) Characterized with a Micro Crystal MS1V-T1K crystal with a load capacitance of 12.5 pF. The internal and external load capacitance are chosen to closely match the required 12.5-pF load.
(4) Low-power mode 3, 12.5-pF crystal, includes SVS test conditions:
Current for watchdog timer clocked by ACLK and RTC clocked by XT1 included. Current for brownout and SVS included (SVSHE = 1).
CPUOFF = 1, SCG0 = 1 SCG1 = 1, OSCOFF = 0 (LPM3),
f_{XT1} = 32768 Hz, $f_{ACLK} = f_{XT1}$, $f_{MCLK} = f_{SMCLK}$ = 0 MHz
(5) Low-power mode 3, VLO, excludes SVS test conditions:
Current for watchdog timer clocked by VLO included. RTC disabled. Current for brownout included. SVS disabled (SVSHE = 0).
CPUOFF = 1, SCG0 = 1 SCG1 = 1, OSCOFF = 0 (LPM3)
f_{XT1} = 32768 Hz, $f_{ACLK} = f_{MCLK} = f_{SMCLK}$ = 0 MHz
(6) RTC periodically wakes up every second with external 32768-Hz input as source.

5.8 Low-Power Mode LPMx.5 Supply Currents (Into V_{CC}) Excluding External Current

5.11 Timing and Switching Characteristics

5.11.1 Power Supply Sequencing

Table 5-2 lists the characteristics of the SVS and BOR.

Table 5-2. PMM, SVS and BOR

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted) (see Figure 5-4)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
$V_{BOR, safe}$	Safe BOR power-down level(1)		0.1			V
$t_{BOR, safe}$	Safe BOR reset delay(2)		10			ms
$I_{SVSH,AM}$	SVS_H current consumption, active mode	V_{CC} = 3.6 V			1.5	µA
$I_{SVSH,LPM}$	SVS_H current consumption, low-power modes	V_{CC} = 3.6 V		240		nA
V_{SVSH-}	SVS_H power-down level(3)		1.71	1.80	1.86	V
V_{SVSH+}	SVS_H power-up level(3)		1.74	1.89	1.99	V
V_{SVSH_hys}	SVS_H hysteresis			80		mV
$t_{PD,SVSH, AM}$	SVS_H propagation delay, active mode				10	µs
$t_{PD,SVSH, LPM}$	SVS_H propagation delay, low-power modes				100	µs
$V_{REF, 1.2V}$	1.2-V REF voltage(4)		1.158	1.20	1.242	V

(1) A safe BOR can be correctly generated only if DVCC drops below this voltage before it rises.
(2) When an BOR occurs, a safe BOR can be correctly generated only if DVCC is kept low longer than this period before it reaches V_{SVSH+}.
(3) For additional information, see the Dynamic Voltage Scaling Power Solution for MSP430 Devices With Single-Channel LDO Reference Design.
(4) This is a characterized result with external 1-mA load to ground from –40°C to 85°C.

5.11.2 Reset Timing

Table 5-3 lists the wake-up times.

Table 5-3. Wake-up Times From Low-Power Modes and Reset

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

PARAMETER		TEST CONDITIONS	V_{CC}	MIN	TYP	MAX	UNIT
$t_{WAKE-UP\ FRAM}$	Additional wake-up time to activate the FRAM in AM if previously disabled by the FRAM controller or from a LPM if immediate activation is selected for wakeup (1)		3 V		10		µs
$t_{WAKE-UP\ LPM0}$	Wake-up time from LPM0 to active mode (1)		3 V			200 + 2.5 / f_{DCO}	ns
$t_{WAKE-UP\ LPM3}$	Wake-up time from LPM3 to active mode (2)		3 V		10		µs
$t_{WAKE-UP\ LPM4}$	Wake-up time from LPM4 to active mode		3 V		10		µs
$t_{WAKE-UP\ LPM3.5}$	Wake-up time from LPM3.5 to active mode (2)		3 V		350		µs
$t_{WAKE-UP\ LPM4.5}$	Wake-up time from LPM4.5 to active mode (2)	SVSHE = 1	3 V		350		µs
		SVSHE = 0			1		ms
$t_{WAKE-UP-RESET}$	Wake-up time from $\overline{RST}$ or BOR event to active mode (2)		3 V		1		ms
t_{RESET}	Pulse duration required at $\overline{RST}$/NMI pin to accept a reset		3 V	2			µs

(1) The wake-up time is measured from the edge of an external wake-up signal (for example, port interrupt or wake-up event) to the first externally observable MCLK clock edge.
(2) The wake-up time is measured from the edge of an external wake-up signal (for example, port interrupt or wake-up event) until the first instruction of the user program is executed.

5.11.3 Clock Specifications

Table 5-4 lists the characteristics of XT1.

Table 5-4. XT1 Crystal Oscillator (Low Frequency)

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)(1)

PARAMETER		TEST CONDITIONS	V_{CC}	MIN	TYP	MAX	UNIT
$f_{XT1,\ LF}$	XT1 oscillator crystal, low frequency	LFXTBYPASS = 0			32768		Hz
$DC_{XT1,\ LF}$	XT1 oscillator LF duty cycle	Measured at MCLK, f_{LFXT} = 32768 Hz		30%		70%	
$f_{XT1,SW}$	XT1 oscillator logic-level square-wave input frequency	LFXTBYPASS = 1 (2)(3)			32.768		kHz
$DC_{XT1,\ SW}$	LFXT oscillator logic-level square-wave input duty cycle	LFXTBYPASS = 1		40%		60%	
OA_{LFXT}	Oscillation allowance for LF crystals (4)	LFXTBYPASS = 0, LFXTDRIVE = {3}, f_{LFXT} = 32768 Hz, $C_{L,eff}$ = 12.5 pF			200		kΩ
$C_{L,eff}$	Integrated effective load capacitance(5)	See (6)			1		pF
$t_{START,LFXT}$	Start-up time (7)	f_{OSC} = 32768 Hz, LFXTBYPASS = 0, LFXTDRIVE = {3}, T_A = 25°C, $C_{L,eff}$ = 12.5 pF			1000		ms
$f_{Fault,LFXT}$	Oscillator fault frequency (8)	XTS = 0(9)		0		3500	Hz

(1) To improve EMI on the LFXT oscillator, observe the following guidelines:
- Keep the trace between the device and the crystal as short as possible.
- Design a good ground plane around the oscillator pins.
- Prevent crosstalk from other clock or data lines into oscillator pins XIN and XOUT.
- Avoid running PCB traces underneath or adjacent to the XIN and XOUT pins.
- Use assembly materials and processes that avoid any parasitic load on the oscillator XIN and XOUT pins.
- If conformal coating is used, make sure that it does not induce capacitive or resistive leakage between the oscillator pins.

(2) When LFXTBYPASS is set, LFXT circuits are automatically powered down. Input signal is a digital square wave with parametrics defined in the Schmitt-trigger inputs section of this data sheet. Duty cycle requirements are defined by $DC_{LFXT,\ SW}$.

(3) Maximum frequency of operation of the entire device cannot be exceeded.

(4) Oscillation allowance is based on a safety factor of 5 for recommended crystals. The oscillation allowance is a function of the LFXTDRIVE settings and the effective load. In general, comparable oscillator allowance can be achieved based on the following guidelines, but should be evaluated based on the actual crystal selected for the application:
- For LFXTDRIVE = {0}, $C_{L,eff}$ = 3.7 pF
- For LFXTDRIVE = {1}, 6 pF ≤ $C_{L,eff}$ ≤ 9 pF
- For LFXTDRIVE = {2}, 6 pF ≤ $C_{L,eff}$ ≤ 10 pF
- For LFXTDRIVE = {3}, 6 pF ≤ $C_{L,eff}$ ≤ 12 pF

(5) Includes parasitic bond and package capacitance (approximately 2 pF per pin).

(6) Requires external capacitors at both terminals to meet the effective load capacitance specified by crystal manufacturers. Recommended effective load capacitance values supported are 3.7 pF, 6 pF, 9 pF, and 12.5 pF. Maximum shunt capacitance of 1.6 pF. The PCB adds additional capacitance, so it must also be considered in the overall capacitance. Verify that the recommended effective load capacitance of the selected crystal is met.

(7) Includes start-up counter of 1024 clock cycles.

(8) Frequencies above the MAX specification do not set the fault flag. Frequencies between the MIN and MAX specifications might set the flag. A static condition or stuck at fault condition sets the flag.

(9) Measured with logic-level input frequency but also applies to operation with crystals.

Table 5-5 lists the characteristics of the FLL.

t_{START}	REFO start-up time	40% to 60% duty cycle			50		µs

(1) Calculated using the box method: (MAX(–40°C to 85°C) – MIN(–40°C to 85°C)) / MIN(–40°C to 85°C) / (85°C – (–40°C))
(2) Calculated using the box method: (MAX(1.8 V to 3.6 V) – MIN(1.8 V to 3.6 V)) / MIN(1.8 V to 3.6 V) / (3.6 V – 1.8 V)

Table 5-8 lists the characteristics of the VLO.

NOTE

The VLO clock frequency is reduced by 15% (typical) when the device switches from active mode to LPM3 or LPM4, because the reference changes. This lower frequency is not a violation of the VLO specifications (see Table 5-8).

Table 5-8. Internal Very-Low-Power Low-Frequency Oscillator (VLO)

5.11.4 Digital I/Os

Table 5-10 lists the characteristics of the digital inputs.

Table 5-10. Digital Inputs

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

PARAMETER		TEST CONDITIONS	V_{CC}	MIN	TYP	MAX	UNIT
V_{IT+}	Positive-going input threshold voltage		2 V	0.90		1.50	V
			3 V	1.35		2.25	
V_{IT-}	Negative-going input threshold voltage		2 V	0.50		1.10	V
			3 V	0.75		1.65	
V_{hys}	Input voltage hysteresis ($V_{IT+} - V_{IT-}$)		2 V	0.3		0.8	V
			3 V	0.4		1.2	
R_{Pull}	Pullup or pulldown resistor	For pullup: $V_{IN} = V_{SS}$ For pulldown: $V_{IN} = V_{CC}$		20	35	50	kΩ
$C_{I,dig}$	Input capacitance, digital only port pins	$V_{IN} = V_{SS}$ or V_{CC}			3		pF
$C_{I,ana}$	Input capacitance, port pins with shared analog functions	$V_{IN} = V_{SS}$ or V_{CC}			5		pF
$I_{lkg(Px.y)}$	High-impedance leakage current	See (1) (2)	2 V, 3 V	–20		20	nA
$t_{(int)}$	External interrupt timing (external trigger pulse duration to set interrupt flag)(3)	Ports with interrupt capability (see block diagram and terminal function descriptions)	2 V, 3 V	50			ns

(1) The leakage current is measured with V_{SS} or V_{CC} applied to the corresponding pins, unless otherwise noted.
(2) The leakage of the digital port pins is measured individually. The port pin is selected for input and the pullup or pulldown resistor is disabled.
(3) An external signal sets the interrupt flag every time the minimum interrupt pulse duration $t_{(int)}$ is met. It may be set by trigger signals shorter than $t_{(int)}$.

Table 5-11 lists the characteristics of the digital outputs.

Table 5-11. Digital Outputs

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted) (also see Figure 5-6, Figure 5-7, Figure 5-8, and Figure 5-9)

PARAMETER		TEST CONDITIONS	V_{CC}	MIN	TYP	MAX	UNIT
V_{OH}	High-level output voltage	$I_{(OHmax)}$ = –3 mA(1)	2 V	1.4		2.0	V
		$I_{(OHmax)}$ = –5 mA(1)	3 V	2.4		3.0	
V_{OL}	Low-level output voltage	$I_{(OLmax)}$ = 3 mA(1)	2 V	0.0		0.60	V
		$I_{(OHmax)}$ = 5 mA(1)	3 V	0.0		0.60	
f_{Port_CLK}	Clock output frequency	C_L = 20 pF(2)	2 V	16			MHz
			3 V	16			
$t_{rise,dig}$	Port output rise time, digital only port pins	C_L = 20 pF	2 V		10		ns
			3 V		7		
$t_{fall,dig}$	Port output fall time, digital only port pins	C_L = 20 pF	2 V		10		ns
			3 V		5		

(1) The maximum total current, $I_{(OHmax)}$ and $I_{(OLmax)}$, for all outputs combined should not exceed ±48 mA to hold the maximum voltage drop specified.
(2) The port can output frequencies at least up to the specified limit and might support higher frequencies.

		ADCON = 1, INCH = 0Ch, Error of conversion result ≤1 LSB, LPM3	3 V	100			

(1) The temperature sensor offset can vary significantly. TI recommends a single-point calibration to minimize the offset error of the built-in temperature sensor.
(2) The device descriptor structure contains calibration values for 30°C and 85°C for each available reference voltage level. The sensor voltage can be computed as $V_{SENSE} = TC_{SENSOR} \times (\text{Temperature, °C}) + V_{SENSOR}$, where TC_{SENSOR} and V_{SENSOR} can be computed from the calibration values for higher accuracy.
(3) The typical equivalent impedance of the sensor is 700 kΩ. The sample time required includes the sensor on time, $t_{SENSOR(on)}$.

5.11.9 FRAM

Table 5-23 lists the characteristics of the FRAM.

(1) Writing to FRAM does not require a setup sequence or additional power when compared to reading from FRAM. The FRAM read current I_{READ} is included in the active mode current consumption parameter $I_{AM,FRAM}$.
(2) FRAM does not require a special erase sequence.
(3) Writing into FRAM is as fast as reading.
(4) The maximum read (and write) speed is specified by f_{SYSTEM} using the appropriate wait state settings (NWAITSx).

$R_{internal}$	Internal pulldown resistance on TEST	2 V, 3 V	20	35	50	kΩ

(1) Tools that access the Spy-Bi-Wire interface must wait for the $t_{SBW,En}$ time after pulling the TEST/SBWTCK pin high before applying the first SBWTCK clock edge.
(2) Maximum $t_{SBW,Ret}$ time after pulling or releasing the TEST/SBWTCK pin low until the Spy-Bi-Wire pins revert from their Spy-Bi-Wire function to their application function. This time applies only if the Spy-Bi-Wire mode is selected.

6 Detailed Description

6.1 Overview

The MSP430FR2433 is an ultra-low-power MCU. The architecture, combined with extensive low-power modes, is optimized to achieve extended battery life in, for example, portable measurement applications. The MCU features four 16-bit timers, three eUSCIs that support UART, SPI, and I^2C, a hardware multiplier, an RTC module with alarm capabilities, and a high-performance 10-bit ADC.

6.2 CPU

The MSP430 CPU has a 16-bit RISC architecture that is highly transparent to the application. All operations, other than program-flow instructions, are performed as register operations in conjunction with seven addressing modes for source operand and four addressing modes for destination operand.

The CPU is integrated with 16 registers that provide reduced instruction execution time. The register-to-register operation execution time is one cycle of the CPU clock.

Four of the registers, R0 to R3, are dedicated as program counter (PC), stack pointer (SP), status register (SR), and constant generator (CG), respectively. The remaining registers are general-purpose registers.

Peripherals are connected to the CPU using data, address, and control buses. Peripherals can be managed with all instructions.

6.3 Operating Modes

The MSP430FR2433 MCU has one active mode and several software-selectable low-power modes of operation (see Table 6-1). An interrupt event can wake the MCU from low-power mode (LPM0 or LPM3), service the request, and restore the MCU back to the low-power mode on return from the interrupt program. Low-power modes LPM3.5 and LPM4.5 disable the core supply to minimize power consumption.

NOTE

XT1CLK and VLOCLK can be active during LPM4 if requested by low-frequency peripherals, such as RTC or WDT.

6.4 Interrupt Vector Addresses

The interrupt vectors and the power-up start address are in the address range 0FFFFh to 0FF80h (see Table 6-2). The vector contains the 16-bit address of the appropriate interrupt-handler instruction sequence.

6.5 Bootloader (BSL)

The BSL lets users program the FRAM or RAM using either the UART serial interface or the I^2C interface. Access to the MCU memory through the BSL is protected by an user-defined password. Use of the BSL requires four pins (see Table 6-3 and Table 6-4). BSL entry requires a specific entry sequence on the $\overline{\text{RST}}$/NMI/SBWTDIO and TEST/SBWTCK pins. This device supports the blank device detection to automatically invoke the BSL, skipping this special entry sequence, to save time and simplify onboard programming. For a complete description of the features of the BSL, see the MSP430 FRAM Device Bootloader (BSL) User's Guide.

6.6 JTAG Standard Interface

The MSP low-power microcontrollers support the standard JTAG interface, which requires four signals for sending and receiving data. The JTAG signals are shared with general-purpose I/O. The TEST/SBWTCK pin enables the JTAG signals. In addition to these signals, the $\overline{\text{RST}}$/NMI/SBWTDIO is required to interface with MSP430 development tools and device programmers. Table 6-5 lists the JTAG pin requirements. For further details on interfacing to development tools and device programmers, see the *MSP430 Hardware Tools User's Guide*. For details on using the JTAG interface, see *MSP430 Programming With the JTAG Interface*.

6.7 Spy-Bi-Wire Interface (SBW)

The MSP low-power microcontrollers support the 2-wire SBW interface. SBW can be used to interface with MSP development tools and device programmers. Table 6-6 lists the SBW interface pin requirements. For further details on interfacing to development tools and device programmers, see the *MSP430 Hardware Tools User's Guide*. For details on using the SBW interface, see the *MSP430 Programming With the JTAG Interface*.

6.8 FRAM

The FRAM can be programmed using the JTAG port, SBW, the BSL, or in-system by the CPU. Features of the FRAM include:

- Byte and word access capability
- Programmable wait state generation
- Error correction coding (ECC)

6.9 Memory Protection

The device features memory protection for user access authority and write protection, including options to:

- Secure the whole memory map to prevent unauthorized access from JTAG port or BSL, by writing JTAG and BSL signatures using the JTAG port, SBW, the BSL, or in-system by the CPU.
- Enable write protection to prevent unwanted write operation to FRAM contents by setting the control bits in the System Configuration 0 register. For detailed information, see the *System Resets, Interrupts, and Operating Modes, System Control Module (SYS)* chapter in the *MP430FR4xx and MP430FR2xx Family User's Guide*.

6.10 Peripherals

Peripherals are connected to the CPU through data, address, and control buses. All peripherals can be handled by using all instructions in the memory map. For complete module description, see the *MP430FR4xx and MP430FR2xx Family User's Guide*.

6.10.1 Power-Management Module (PMM)

The PMM includes an integrated voltage regulator that supplies the core voltage to the device. The PMM also includes supply voltage supervisor (SVS) and brownout protection. The brownout reset circuit (BOR) is implemented to provide the proper internal reset signal to the device during power on and power off. The SVS circuitry detects if the supply voltage drops below a user-selectable safe level. SVS circuitry is available on the primary supply.

The device contains two on-chip reference: 1.5 V for internal reference and 1.2 V for external reference.

The 1.5-V reference is internally connected to ADC channel 13. DVCC is internally connected to ADC channel 15. When DVCC is set as the reference voltage for ADC conversion, the DVCC can be easily represent as Equation 1 by using ADC sampling 1.5-V reference without any external components support.

$$DVCC = (1023 \times 1.5\ V) \div 1.5\text{-}V\ reference\ ADC\ result \quad (1)$$

A 1.2-V reference voltage can be buffered and output to P1.4/MCLK/TCK/A4/VREF+, when EXTREFEN = 1 in the PMMCTL1 register. ADC channel 4 can also be selected to monitor this voltage. For more detailed information, see the *MP430FR4xx and MP430FR2xx Family User's Guide*.

6.10.2 Clock System (CS) and Clock Distribution

The clock system includes a 32-kHz crystal oscillator (XT1), an internal very-low-power low-frequency oscillator (VLO), an integrated 32-kHz RC oscillator (REFO), an integrated internal digitally controlled oscillator (DCO) that may use frequency-locked loop (FLL) locking with internal or external 32-kHz reference clock, and an on-chip asynchronous high-speed clock (MODOSC). The clock system is designed for cost-effective designs with minimal external components. A fail-safe mechanism is included for XT1. The clock system module offers the following clock signals.

- Main Clock (MCLK): The system clock used by the CPU and all relevant peripherals accessed by the bus. All clock sources except MODOSC can be selected as the source with a predivider of 1, 2, 4, 8, 16, 32, 64, or 128.
- Sub-Main Clock (SMCLK): The subsystem clock used by the peripheral modules. SMCLK derives from the MCLK with a predivider of 1, 2, 4, or 8. This means SMCLK is always equal to or less than MCLK.
- Auxiliary Clock (ACLK): This clock is derived from the external XT1 clock or internal REFO clock up to 40 kHz.

All peripherals may have one or several clock sources depending on specific functionality. Table 6-7 lists the clock distribution used in this device.

6.10.3 General-Purpose Input/Output Port (I/O)

Up to 19 I/O ports are implemented.

- P1 and P2 are full 8-bit ports; P3 has 3 bits implemented.
- All individual I/O bits are independently programmable.
- Any combination of input, output, and interrupt conditions is possible.
- All ports support programmable pullup or pulldown.
- Edge-selectable interrupt and LPM3.5 and LPM4.5 wake-up input capability is available for P1 and P2.
- Read and write access to port-control registers is supported by all instructions.
- Ports can be accessed byte-wise or word-wise in pairs.

NOTE

Configuration of digital I/Os after BOR reset

To prevent any cross currents during start-up of the device, all port pins are high-impedance with Schmitt triggers and module functions disabled. To enable the I/O functions after a BOR reset, the ports must be configured first and then the LOCKLPM5 bit must be cleared. For details, see the *Configuration After Reset* section in the *Digital I/O* chapter of the *MP430FR4xx and MP430FR2xx Family User's Guide*.

6.10.4 Watchdog Timer (WDT)

The primary function of the WDT module is to perform a controlled system restart after a software problem occurs. If the selected time interval expires, a system reset is generated. If the watchdog function is not needed in an application, the module can be configured as interval timer and can generate interrupts at selected time intervals. Table 6-8 lists the system clocks that can be used to source the WDT.

Table 6-8. WDT Clocks

WDTSSEL	NORMAL OPERATION (WATCHDOG AND INTERVAL TIMER MODE)
00	SMCLK
01	ACLK
10	VLOCLK

6.10.5 System (SYS) Module

The SYS module handles many of the system functions within the device. These features include power-on reset (POR) and power-up clear (PUC) handling, NMI source selection and management, reset interrupt vector generators, bootloader entry mechanisms, and configuration management (device descriptors). The SYS module also includes a data exchange mechanism through SBW called a JTAG mailbox mail box that can be used in the application. Table 6-9 summarizes the interrupts that are managed by the SYS module.

6.10.6 Cyclic Redundancy Check (CRC)

The 16-bit cyclic redundancy check (CRC) module produces a signature based on a sequence of data values and can be used for data checking purposes. The CRC generation polynomial is compliant with CRC-16-CCITT standard of $x^{16} + x^{12} + x^5 + 1$.

6.10.7 Enhanced Universal Serial Communication Interface (eUSCI_A0, eUSCI_B0)

The eUSCI modules are used for serial data communications. The eUSCI_A module supports either UART or SPI communications. The eUSCI_B module supports either SPI or I^2C communications. Additionally, eUSCI_A supports automatic baud-rate detection and IrDA. Table 6-10 lists the pin configurations that are required for each eUSCI mode.

6.10.8 Timers (Timer0_A3, Timer1_A3, Timer2_A2 and Timer3_A2)

The Timer0_A3 and Timer1_A3 modules are 16-bit timers and counters with three capture/compare registers each. Both timers support multiple captures or compares, PWM outputs, and interval timing (see Table 6-11 and Table 6-12). Both timers have extensive interrupt capabilities. Interrupts may be generated from the counter on overflow conditions and from each capture/compare register.

The CCR0 registers on Timer0_A3 and Timer1_A3 are not externally connected and can be used only for hardware period timing and interrupt generation. In Up mode, these CCR0 registers can be used to set the overflow value of the counter.

The interconnection of Timer0_A3 and Timer1_A3 can be used to modulate the eUSCI_A pin of UCA0TXD/UCA0SIMO in either ASK or FSK mode, with which a user can easily acquire a modulated infrared command for directly driving an external IR diode. The IR functions are fully controlled by SYS configuration registers 1 including IREN (enable), IRPSEL (polarity select), IRMSEL (mode select), IRDSSEL (data select), and IRDATA (data) bits. For more information, see the *System Resets, Interrupts, and Operating Modes, System Control Module (SYS)* chapter in the *MP430FR4xx and MP430FR2xx Family User's Guide*.

The Timer2_A2 and Timer3_A2 modules are 16-bit timers and counters with two capture/compare registers each. Both timers support multiple captures or compares and interval timing (see Table 6-13 and Table 6-14). Both timers have extensive interrupt capabilities. Interrupts may be generated from the counter on overflow conditions and from each capture register.

The CCR0 registers on Timer2_TA2 and Timer3_TA2 are not externally connected and can be used only for hardware period timing and interrupt generation. In Up mode, these CCR0 registers can be used to set the overflow value of the counter. Timer2_A2 and Timer3_A2 are only internally connected and do not support PWM output.

6.10.9 Hardware Multiplier (MPY)

The multiplication operation is supported by a dedicated peripheral module. The module performs operations with 32-, 24-, 16-, and 8-bit operands. The MPY module supports signed multiplication, unsigned multiplication, signed multiply-and-accumulate, and unsigned multiply-and-accumulate operations.

6.10.10 Backup Memory (BAKMEM)

The BAKMEM supports data retention during LPM3.5. This device provides up to 32 bytes that are retained during LPM3.5.

6.10.11 Real-Time Clock (RTC)

The RTC is a 16-bit modulo counter that is functional in AM, LPM0, LPM3, and LPM3.5. This module may periodically wake up the CPU from LPM0, LPM3, and LPM3.5 based on timing from a low-power clock source such as the XT1 and VLO clocks. In AM, SMCLK can drive the RTC to generate high-frequency timing events and interrupts. The RTC overflow events trigger:

- Timer0_A3 CCR1B
- ADC conversion trigger when ADCSHSx bits are set as 01b

6.10.12 10-Bit Analog-to-Digital Converter (ADC)

The 10-bit ADC module supports fast 10-bit analog-to-digital conversions with single-ended input. The module implements a 10-bit SAR core, sample select control, reference generator and a conversion result buffer. A window comparator with lower and upper limits allows CPU-independent result monitoring with three window comparator interrupt flags.

The ADC supports 10 external inputs and 4 internal inputs (see Table 6-15).

(1) When A4 is used, the PMM 1.2-V reference voltage can be output to this pin by setting the PMM control register. The 1.2-V voltage can be directly measured by A4 channel.

Software or a hardware trigger can start the analog-to-digital conversion. Table 6-16 lists the trigger sources that are available.

6.10.13 Embedded Emulation Module (EEM)

The EEM supports real-time in-system debugging. The EEM on these devices has the following features:

- Three hardware triggers or breakpoints on memory access
- One hardware trigger or breakpoint on CPU register write access
- Up to four hardware triggers that can be combined to form complex triggers or breakpoints
- One cycle counter
- Clock control on module level
- EEM version: S

		1A23h	Per unit

(2) This value can be directly loaded into DCO bits in CSCTL0 registers to get accurate 16-MHz frequency at room temperature, especially when the MCU exits from LPM3 and below. TI suggests using the predivider to decrease the frequency if the temperature drift might result an overshoot beyond 16 MHz.

6.14 Identification

6.14.1 Revision Identification

The device revision information is included as part of the top-side marking on the device package. The device-specific errata sheet describes these markings (see Section 8.4).

The hardware revision is also stored in the Device Descriptor structure in the Information Block section. For details on this value, see the Hardware Revision entries in Table 6-22.

6.14.2 Device Identification

The device type can be identified from the top-side marking on the device package. The device-specific errata sheet describes these markings (see Section 8.4).

A device identification value is also stored in the Device Descriptor structure in the Information Block section. For details on this value, see the Device ID entries in Table 6-22.

6.14.3 JTAG Identification

Programming through the JTAG interface, including reading and identifying the JTAG ID, is described in *MSP430 Programming With the JTAG Interface*.

7 Applications, Implementation, and Layout

NOTE

Information in the following Applications section is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

7.1 Device Connection and Layout Fundamentals

This section discusses the recommended guidelines when designing with the MSP430 devices. These guidelines are to make sure that the device has proper connections for powering, programming, debugging, and optimum analog performance.

7.1.1 Power Supply Decoupling and Bulk Capacitors

TI recommends connecting a combination of a 10-µF and a 100-nF low-ESR ceramic decoupling capacitor to the DVCC and DVSS pins (see Figure 7-1). Higher-value capacitors may be used but can impact supply rail ramp-up time. Decoupling capacitors must be placed as close as possible to the pins that they decouple (within a few millimeters). Additionally, TI recommends separated grounds with a single-point connection for better noise isolation from digital-to-analog circuits on the board and to achieve high analog accuracy.

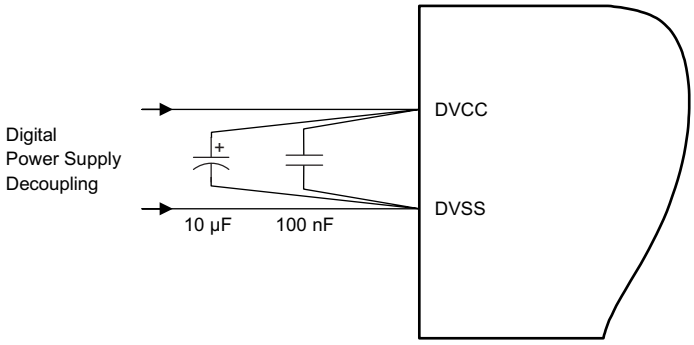

Figure 7-1. Power Supply Decoupling

7.1.2 External Oscillator

This device supports only a low-frequency crystal (32 kHz) on the XIN and XOUT pins. External bypass capacitors for the crystal oscillator pins are required.

It is also possible to apply digital clock signals to the XIN input pin that meet the specifications of the respective oscillator if the appropriate XT1BYPASS mode is selected. In this case, the associated XOUT pin can be used for other purposes. If the XIN and XOUT pins are not used, they must be terminated according to Section 4.6.

Figure 7-2 shows a typical connection diagram.

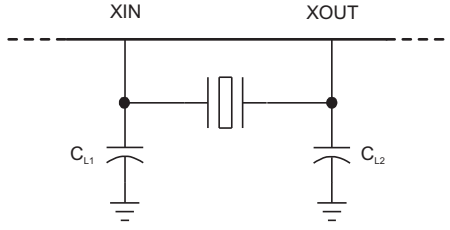

Figure 7-2. Typical Crystal Connection

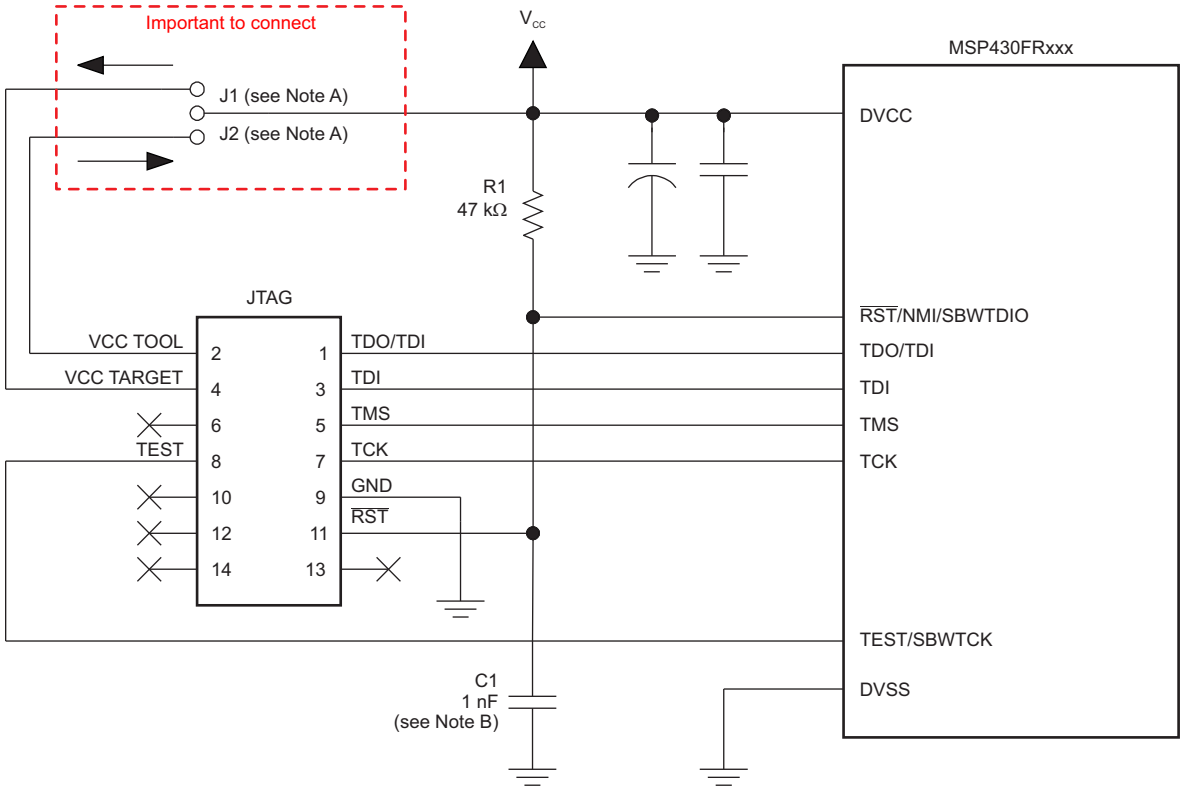
See *MSP430 32-kHz Crystal Oscillators* for more information on selecting, testing, and designing a crystal oscillator with the MSP430 devices.

7.1.3 JTAG

With the proper connections, the debugger and a hardware JTAG interface (such as the MSP-FET or MSP-FET430UIF) can be used to program and debug code on the target board. In addition, the connections also support the MSP-GANG production programmers, thus providing an easy way to program prototype boards, if desired. Figure 7-3 shows the connections between the 14-pin JTAG connector and the target device required to support in-system programming and debugging for 4-wire JTAG communication. Figure 7-4 shows the connections for 2-wire JTAG mode (Spy-Bi-Wire).

The connections for the MSP-FET and MSP-FET430UIF interface modules and the MSP-GANG are identical. Both can supply V_{CC} to the target board (through pin 2). In addition, the MSP-FET and MSP-FET430UIF interface modules and MSP-GANG have a V_{CC} sense feature that, if used, requires an alternate connection (pin 4 instead of pin 2). The V_{CC} sense feature detects the local V_{CC} present on the target board (that is, a battery or other local power supply) and adjusts the output signals accordingly. Figure 7-3 and Figure 7-4 show a jumper block that supports both scenarios of supplying V_{CC} to the target board. If this flexibility is not required, the desired V_{CC} connections may be hard-wired to eliminate the jumper block. Pins 2 and 4 must not be connected at the same time.

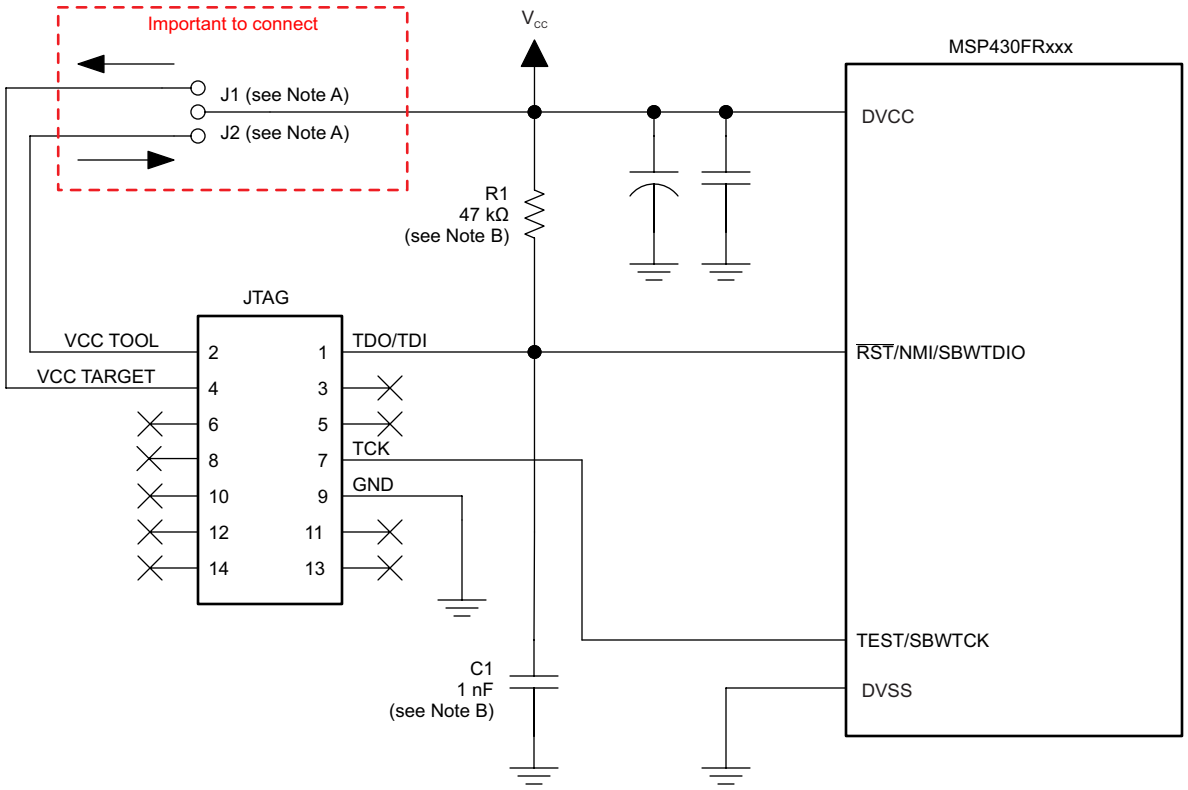
For additional design information regarding the JTAG interface, see the *MSP430 Hardware Tools User's Guide*.



A. If a local target power supply is used, make connection J1. If power from the debug or programming adapter is used, make connection J2.

B. The upper limit for C1 is 1.1 nF when using current TI tools.

Figure 7-3. Signal Connections for 4-Wire JTAG Communication



A. Make connection J1 if a local target power supply is used, or make connection J2 if the target is powered from the debug or programming adapter.

B. The device $\overline{\text{RST}}$/NMI/SBWTDIO pin is used in 2-wire mode for bidirectional communication with the device during JTAG access, and any capacitance that is attached to this signal may affect the ability to establish a connection with the device. The upper limit for C1 is 1.1 nF when using current TI tools.

Figure 7-4. Signal Connections for 2-Wire JTAG Communication (Spy-Bi-Wire)

7.1.4 Reset

The reset pin can be configured as a reset function (default) or as an NMI function in the Special Function Register (SFR), SFRRPCR.

In reset mode, the $\overline{\text{RST}}$/NMI pin is active low, and a pulse applied to this pin that meets the reset timing specifications generates a BOR-type device reset.

Setting SYSNMI causes the $\overline{\text{RST}}$/NMI pin to be configured as an external NMI source. The external NMI is edge sensitive, and its edge is selectable by SYSNMIIES. Setting the NMIIE enables the interrupt of the external NMI. When an external NMI event occurs, the NMIIFG is set.

The $\overline{\text{RST}}$/NMI pin can have either a pullup or pulldown that is enabled or not. SYSRSTUP selects either pullup or pulldown, and SYSRSTRE causes the pullup (default) or pulldown to be enabled (default) or not. If the $\overline{\text{RST}}$/NMI pin is unused, it is required either to select and enable the internal pullup or to connect an external 47-kΩ pullup resistor to the $\overline{\text{RST}}$/NMI pin with a 1.1-nF pulldown capacitor. The pulldown capacitor should not exceed 1.1 nF when using devices with Spy-Bi-Wire interface in Spy-Bi-Wire mode or in 4-wire JTAG mode with TI tools like FET interfaces or GANG programmers.

See the *MSP430FR4xx and MSP430FR2xx Family User's Guide* for more information on the referenced control registers and bits.

7.1.5 Unused Pins

For details on the connection of unused pins, see Section 4.6.

7.1.6 General Layout Recommendations

- Proper grounding and short traces for external crystal to reduce parasitic capacitance. For recommended layout guidelines, see *MSP430 32-kHz Crystal Oscillators*.
- Proper bypass capacitors on DVCC and reference pins, if used.
- Avoid routing any high-frequency signal close to an analog signal line. For example, keep digital switching signals such as PWM or JTAG signals away from the oscillator circuit and ADC signals.
- Proper ESD level protection should be considered to protect the device from unintended high-voltage electrostatic discharge. For guidelines see *MSP430 System-Level ESD Considerations*.

7.1.7 Do's and Don'ts

During power up, power down, and device operation, DVCC must not exceed the limits specified in Section 5.1. Exceeding the specified limits may cause malfunction of the device including erroneous writes to RAM and FRAM.

7.2 Peripheral- and Interface-Specific Design Information

7.2.1 ADC Peripheral

7.2.1.1 Partial Schematic

Figure 7-5 shows the recommended decoupling circuit when an external voltage reference is used.

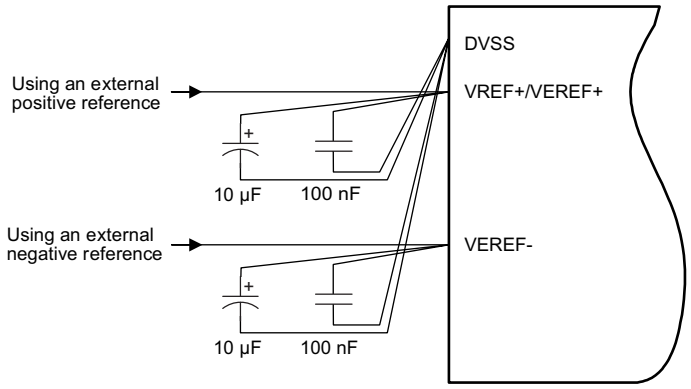


Figure 7-5. ADC Grounding and Noise Considerations

7.2.1.2 Design Requirements

As with any high-resolution ADC, appropriate PCB layout and grounding techniques must be followed to eliminate ground loops, unwanted parasitic effects, and noise.

Ground loops are formed when return current from the ADC flows through paths that are common with other analog or digital circuitry. If care is not taken, this current can generate small unwanted offset voltages that can add to or subtract from the reference or input voltages of the ADC. The general guidelines in Section 7.1.1 combined with the connections shown in Figure 7-5 prevent this.

Quickly switching digital signals and noisy power supply lines can corrupt the conversion results, so keep the ADC input trace shielded from those digital and power supply lines. Putting the MCU in low-power mode during the ADC conversion improves the ADC performance in a noisy environment. If the device includes the analog power pair inputs (AVCC and AVSS), TI recommends a noise-free design using separate analog and digital ground planes with a single-point connection to achieve high accuracy.

Figure 7-5 shows the recommended decoupling circuit when an external voltage reference is used. The internal reference module has a maximum drive current as described in the sections *ADC Pin Enable* and *1.2-V Reference Settings* of the *MSP430FR4xx and MSP430FR2xx Family User's Guide*.

The reference voltage must be a stable voltage for accurate measurements. The capacitor values that are selected in the general guidelines filter out the high- and low-frequency ripple before the reference voltage enters the device. In this case, the 10-µF capacitor buffers the reference pin and filters any low-frequency ripple. A bypass capacitor of 100 nF filters out any high-frequency noise.

7.2.1.3 Layout Guidelines

Components that are shown in the partial schematic (see Figure 7-5) should be placed as close as possible to the respective device pins to avoid long traces, because they add additional parasitic capacitance, inductance, and resistance on the signal.

Avoid routing analog input signals close to a high-frequency pin (for example, a high-frequency PWM), because the high-frequency switching can be coupled into the analog signal.

8.2 Device Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all MSP MCU devices. Each MSP MCU commercial family member has one of two prefixes: MSP or XMS. These prefixes represent evolutionary stages of product development from engineering prototypes (XMS) through fully qualified production devices (MSP).

XMS – Experimental device that is not necessarily representative of the final device's electrical specifications

MSP – Fully qualified production device

XMS devices are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

MSP devices have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (XMS) have a greater failure rate than the standard production devices. TI recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the temperature range, package type, and distribution format. Figure 8-1 provides a legend for reading the complete device name.

Design Kits and Evaluation Modules

MSP-FET and MSP-TS430RGE24A Evaluation Module Bundle

The MSP-FET is a powerful flash emulation tool to quickly begin application development on MSP430 microcontrollers. The MSP-FET includes a USB interface to program and debug the MSP430 in system through the JTAG interface or the pin-saving Spy-Bi-Wire (2-wire JTAG) protocol. The enclosed MSP-FET development tool supports development with all MSP430 devices.

Software

MSP430Ware Software

MSP430Ware is a collection of design resources that help users to effectively create and build MSP430 code. MSP430Ware includes a wide selection of highly abstracted software libraries – ranging from device and peripheral-specific libraries such as MSP430 Driver Library or USB, to application-specific libraries such as the graphics and capacitive touch libraries. In particular, the MSP430 Driver Library is an essential library to help software developers leverage convenient APIs to control low-level and intricate hardware peripherals, making the resulting code much easier to read and maintain.

MSP430FR243x, MSP430FR253x, MSP430FR263x Code Examples

C code examples are available for every MSP device that configures each integrated peripheral for various application needs.

MSP Driver Library

The abstracted API of MSP Driver Library provides easy-to-use function calls that free you from directly manipulating the bits and bytes of the MSP430 hardware. Thorough documentation is delivered through a helpful API Guide, which includes details on each function call and the recognized parameters. Developers can use Driver Library functions to write complete projects with minimal overhead.

MSP EnergyTrace™ Technology

EnergyTrace technology for MSP430 microcontrollers is an energy-based code analysis tool that measures and displays the energy profile of the application and helps to optimize it for ultra-low-power consumption.

ULP (Ultra-Low Power) Advisor

ULP Advisor™ software is a tool for guiding developers to write more efficient code to fully use the unique ultra-low-power features of MSP and MSP432 microcontrollers. Aimed at both experienced and new microcontroller developers, ULP Advisor checks your code against a thorough ULP checklist to help minimize the energy consumption of your application. At build time, ULP Advisor provides notifications and remarks to highlight areas of your code that can be further optimized for lower power.

IEC60730 Software Package

The IEC60730 MSP430 software package was developed to help customers comply with IEC 60730-1:2010 (Automatic Electrical Controls for Household and Similar Use – Part 1: General Requirements) for up to Class B products, which includes home appliances, arc detectors, power converters, power tools, e-bikes, and many others. The IEC60730 MSP430 software package can be embedded in customer applications running on MSP430s to help simplify the customer's certification efforts of functional safety-compliant consumer devices to IEC 60730-1:2010 Class B.

Fixed Point Math Library for MSP

The MSP IQmath and Qmath libraries are collections of highly optimized and high-precision mathematical functions for C programmers to seamlessly port a floating-point algorithm into fixed-point code on MSP430 and MSP432 devices. These routines are typically used in computationally intensive real-time applications where optimal execution speed, high accuracy, and ultra-low energy are critical. By using the IQmath and Qmath libraries, it is possible to achieve execution speeds considerably faster and energy consumption considerably lower than equivalent code written using floating-point math.

Floating Point Math Library for MSP430

Continuing to innovate in the low-power and low-cost microcontroller space, TI provides MSPMATHLIB. Leveraging the intelligent peripherals of our devices, this floating-point math library of scalar functions that are up to 26 times faster than the standard MSP430 math functions. Mathlib is easy to integrate into your designs. This library is free and is integrated in both Code Composer Studio IDE and IAR Embedded Workbench IDE.

Development Tools

Code Composer Studio™ Integrated Development Environment for MSP Microcontrollers

Code Composer Studio (CCS) integrated development environment (IDE) supports all MSP microcontroller devices. CCS comprises a suite of embedded software utilities used to develop and debug embedded applications. It includes an optimizing C/C++ compiler, source code editor, project build environment, debugger, profiler, and many other features.

Command-Line Programmer

MSP Flasher is an open-source shell-based interface for programming MSP microcontrollers through a FET programmer or eZ430 using JTAG or Spy-Bi-Wire (SBW) communication. MSP Flasher can download binary files (.txt or .hex) directly to the MSP microcontroller without an IDE.

MSP MCU Programmer and Debugger

The MSP-FET is a powerful emulation development tool – often called a debug probe – that lets users quickly begin application development on MSP low-power microcontrollers (MCU). Creating MCU software usually requires downloading the resulting binary program to the MSP device for validation and debugging. The MSP-FET provides a debug communication pathway between a host computer and the target MSP. Furthermore, the MSP-FET also provides a backchannel UART connection between the computer's USB interface and the MSP UART. This affords the MSP programmer a convenient method for communicating serially between the MSP and a terminal running on the computer.

MSP-GANG Production Programmer

The MSP Gang Programmer can program up to eight identical MSP430 or MSP432 flash or FRAM devices at the same time. The MSP Gang Programmer connects to a host PC using a standard RS-232 or USB connection and provides flexible programming options that allow the user to fully customize the process. The MSP Gang Programmer is provided with an expansion board, called the Gang Splitter, that implements the interconnections between the MSP Gang Programmer and multiple target devices.

Application Reports

MSP430 FRAM Technology – How To and Best Practices

FRAM is a nonvolatile memory technology that behaves similar to SRAM while enabling a whole host of new applications, but also changing the way firmware should be designed. This application report outlines the how to and best practices of using FRAM technology in MSP430 from an embedded software development perspective. It discusses how to implement a memory layout according to application-specific code, constant, data space requirements, and the use of FRAM to optimize application energy consumption.

VLO Calibration on the MSP430FR4xx and MSP430FR2xx Family

MSP430FR4xx and MSP430FR2xx (FR4xx/FR2xx) family microcontrollers (MCUs) provide various clock sources, including some high-speed high-accuracy clocks and some low-power low-system-cost clocks. Users can select the best balance of performance, power consumption, and system cost. The on-chip very low-frequency oscillator (VLO) is a clock source with 10-kHz typical frequency included in FR4xx/FR2xx family MCUs. The VLO is widely used in a range of applications because of its ultra-low power consumption.

MSP430 32-kHz Crystal Oscillators

Selection of the right crystal, correct load circuit, and proper board layout are important for a stable crystal oscillator. This application report summarizes crystal oscillator function and explains the parameters to select the correct crystal for MSP430 ultra-low-power operation. In addition, hints and examples for correct board layout are given. The document also contains detailed information on the possible oscillator tests to ensure stable oscillator operation in mass production.

MSP430 System-Level ESD Considerations

System-level ESD has become increasingly demanding with silicon technology scaling towards lower voltages and the need for designing cost-effective and ultra-low-power components. This application report addresses different ESD topics to help board designers and OEMs understand and design robust system-level designs.

8.7 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

8.8 Export Control Notice

9 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, see the left-hand navigation.

(1) **Status:** For more details on status, see our product life cycle.

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative
