

**TPS1H200A-Q1** 

SLVSEE0D - FEBRUARY 2018 - REVISED SEPTEMBER 2021

## TPS1H200A-Q1 40-V 200-mΩ Single-Channel Smart High-Side Switch

#### 1 Features

- Qualified for automotive applications
- AEC-Q100 qualified with the following results:
  - Device temperature grade 1: -40°C to +125°C ambient operating temperature range
  - Device HBM ESD Classification Level H2
  - Device CDM ESD Classification Level C4B
- Functional Safety-Capable
  - Documentation available to aid functional safety system design
- Single-channel 200-mω smart high-side switch
- Wide operating voltage: 3.4 V to 40 V
- Ultra-low standby current, < 500 nA
- Adjustable current limit with external resistor
  - ±15% when ≥ 500 mA
  - ±10% when ≥ 1.5 A
- Configurable behavior after current limit
  - Holding mode
  - Latch-off mode with adjustable delay time
  - Auto-retry mode
- Supports stand-alone operation without an MCU
- Protection:
  - Short-to-GND and overload protection
  - Thermal shutdown and thermal swing
  - Negative voltage clamp for inductive loads
  - Loss of GND and loss of battery protection

- Diagnostics:
  - Overload and short-to-GND detection
  - Open-load and short-to-battery detection in ON or OFF state
  - Thermal shutdown and thermal swing

### 2 Applications

- **Body lighting**
- Infotainment system
- Advanced Driver Assistance Systems (ADAS)
- Single-channel high-side switch for submodules
- General resistive, inductive, and capacitive loads

### 3 Description

The TPS1H200A-Q1 device is a fully protected singlechannel high-side power switch with an integrated 200-m $\Omega$  NMOS power FET.

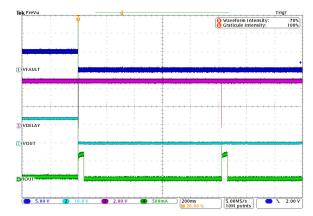

An adjustable current limit improves system reliability by limiting the inrush or overload current. The high accuracy of the current limit improves overload protection, simplifying the front-stage power design. Configurable features besides current limit provide design flexibility in functionality, cost, and thermal dissipation.

The device supports full diagnostics with the digital status output. Open-load detection is available in ON and OFF states. The device supports operation with or without an MCU. Stand-alone mode allows isolated systems to use the device.

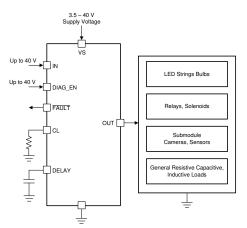

#### Device Information<sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE (NOM)
TPS1H200A-Q1	HVSSOP (8)	3.00 mm × 3.00 mm

For all available packages, see the orderable addendum at the end of the data sheet.

<sup>(1)</sup> Value specified by design, not subject to production test.

### **6.7 Typical Characteristics**

### **6.7 Typical Characteristics (continued)**

### 7 Detailed Description

#### 7.1 Overview

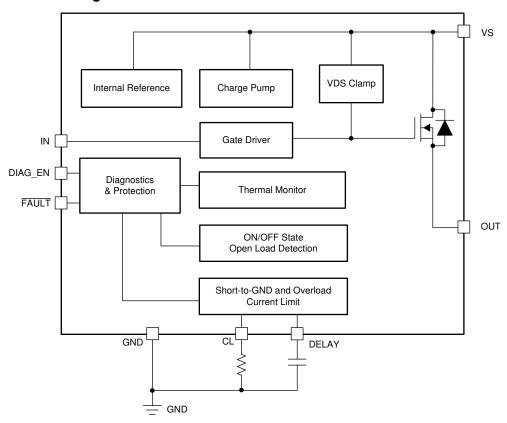

The TPS1H200A-Q1 device is a smart high-side switch with an internal charge pump and single-channel integrated NMOS power FET. The adjustable current limit function improves the reliability of the whole system. Full diagnostic features enable intelligent control of the load.

The external high-accuracy current limit sets the current limit value for the application. When overcurrent occurs, the device improves system reliability by clamping the inrush current effectively. The device saves system cost by reducing the size of PCB traces and connectors, and the capacity of the preceding power stage. The TPS1H200A-Q1 device allows three modes when a current limit occurs. Users can set the output to consistently hold the current, to immediately latch off, or to automatically retry through the configuration on the DELAY pin. The configurable behaviors during a current limit provide design flexibility. This includes functionality, cost, and thermal dissipation.

This device supports full diagnostics with the digital status output. High-accuracy and low-threshold open-load detection enables real-time ON state monitoring. The device supports operation without an MCU (stand-alone mode) which allows the system to locally implement full functionality.

The TPS1H200A-Q1 device is a smart high-side switch for a wide variety of resistive, inductive, and capacitive loads, including LEDs, bulbs, relays, solenoids, and submodules.

#### 7.3 Feature Description

#### 7.3.1 Current limit

A high-accuracy current limit allows high reliability of the design. The current limit protects the load and the power supply from overstressing during short-circuit-to-GND or power-up conditions. The current limit can also save system cost by reducing the size of PCB traces and connectors, and the capacity of the preceding power stage.

When a current limit threshold is hit, a closed loop immediately activates. The output current is clamped at the set value, and a fault is reported. The device heats up because of high power dissipation on the power FET.

The device has two current limit thresholds.

- Internal current limit: The internal current limit is fixed at I<sub>CL(int)</sub>. Tie the CL pin directly to the device GND for large-transient-current applications.
- External adjustable current limit: An external resistor is used to set the current limit threshold. Use Equation
  1 to calculate R<sub>(CL)</sub>. The external adjustable current limit allows the flexibility to set the current limit value by
  application.

$$R_{CL} = \frac{V_{CL(th)} \times K_{(CL)}}{I_{OUT}}$$
(1)

#### where

- V<sub>CL(th)</sub> is the internal band-gap voltage.
- K<sub>(CL)</sub> is the ratio of the output current and the current limit set value.
- K<sub>(CL)</sub> is constant across temperature and supply voltage.

#### Note

When a GND network is used, that causes a level shift between the device GND and board GND, so the CL pin must be connected to the device GND.

For better protection from a hard short-to-GND condition (when the IN pin is enabled, a short-to-GND occurs suddenly), the device will implement a fast-trip protection to turn off the output before the current limit closed loop is set up. Typically, the fast-trip response time is less than 1 µs. With a fast response like this, the device can achieve a better inrush current-suppression performance.

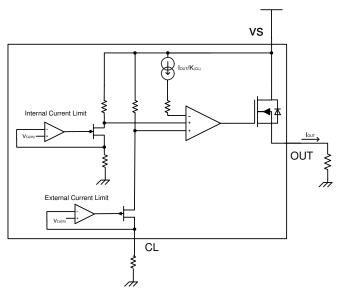

Figure 7-1. Current Limit

### 7.3.2 DELAY Pin Configuration

When a current limit occurs, the TPS1H200A-Q1 device supports three different outcomes of the output. Table 7-1 lists the current limit configurations and these outcomes behaviors.

**Table 7-1. Current Limit Configurations** 

MODE	DELAY CONFIGURATION	OUTPUT CURRENT BEHAVIOR	FAULT RECOVERY
Holding	Connects to GND directly	When hitting a current limit, the output current holds at the setting current. The device enters into thermal shutdown mode when $T_J > T_{(SD)}$ .	FAULT clears when IN turns low for a duration of time longer than t FAULT or when the current limit is removed when IN is high.
Latch-off	Connects to GND through a capacitor	When hitting a current limit, the output current holds at the setting current, but latches off after a preset DELAY time $(t_{dl1}+t_{dl2})$ . $t_{dl1}$ is the default delay time, and $t_{dl2}$ is a capacitor-configurable delay time. The output stays latched off regardless of whether the current limit is removed. The output recovers only when IN is toggling.	FAULT clears when IN turns low for a duration of time longer than t FAULT.
Auto-retry	External pullup	When hitting a current limit, the output current holds at the setting current, but periodically comes on for $t_{\text{hic(on)}}$ and turns off for $t_{\text{hic(off)}}$ .	FAULT clears when IN turns low for a duration of time longer than t FAULT OR when the current limit is removed for thic(on).

#### 7.3.2.1 Holding Mode

Holding mode is active when the DELAY pin connects directly to GND. When a current limit is reached, the output current holds at the setting current. The device then enters thermal shutdown mode when  $T_J > T_{(SD)}$ .

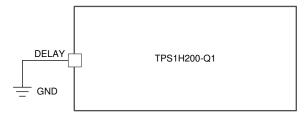

Figure 7-2. Holding Mode Connection

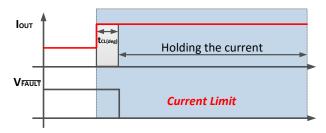

Figure 7-3. Holding Mode Example

#### 7.3.2.2 Latch-Off Mode

Latch-off mode is active when the DELAY pin connects to GND through a capacitor. When a current limit is reached, the output current holds at the setting current, but latches off after a preset DELAY time ( $t_{dl1}$ +  $t_{dl2}$ ).  $t_{dl1}$  is the default delay time, and  $t_{dl2}$  is a configurable delay time set by a capacitor. Regardless of whether the current limit is removed or not, the output remains latched off. The output only recovers when IN is toggling.

 $t_{dl2}$  can be calculated by Equation 2.

$$C_{DELAY} = \frac{I_{dl(chg)} \times t_{dl2}}{V_{dl(ref)}}$$
 (2)

#### where

- C<sub>DELAY</sub> is the capacitor connected on the DELAY pin.
- The I<sub>dl(chg)</sub> is the device that charges the current in latch-off mode.
- t<sub>dl2</sub> is the user-setting delay time.
- V<sub>dl(ref)</sub> is the internal reference voltage in latch-off mode.

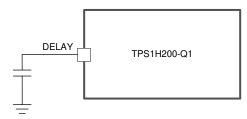

Figure 7-4. Latch-Off-Mode Connection

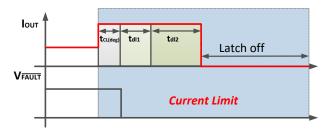

Figure 7-5. Latch-Off-Mode Example

Submit Document Feedback

Copyright © 2021 Texas Instruments Incorporated

### 7.3.2.3 Auto-Retry Mode

Auto-retry mode is active when the DELAY pin is externally pulled up. The pullup voltage must be higher than  $V_{dl(th)}$ . When the current limit is reached, the output current holds at the setting current, but periodically turns on for  $t_{hic(on)}$  and turns off for  $t_{hic(off)}$ . The device checks the current limit status at the falling edge of  $t_{hic(on)}$  clock. If current limit status is captured, the device shuts down for  $t_{hic(off)}$ . If the current limit status is not captured because of the off window during the thermal conditions, the device keeps turning on for additional  $t_{hic(on)}$  or more until the current limit status is captured.

Figure 7-6. Auto-Retry-Mode Connection

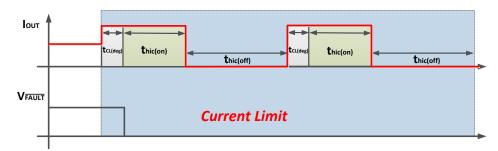

Figure 7-7. Auto-Retry-Mode Example

#### 7.3.3 Stand-alone Operation

In a typical application, the TPS1H200A-Q1 device is controlled by a microcontroller. The device also supports stand-alone operation. IN and DIAG\_EN have a 40-V maximum DC rating, and can be connected to the VS pin directly. When in auto-retry mode, the DELAY pin is connected to the VS pin through a  $100-k\Omega$  resistor.

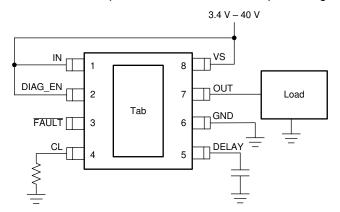

Figure 7-8. Stand-Alone Operation in Latch-Off Mode

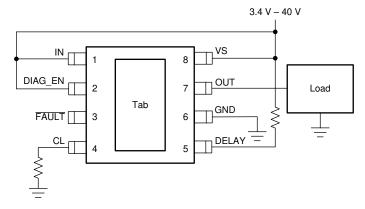

Figure 7-9. Stand-Alone Operation in Auto-Retry Mode

#### 7.3.4 Fault Truth Table

The DIAG\_EN pin enables or disables the diagnostic functions. If multiple devices are used, but the ADC resource is limited in the microcontroller, the microcontroller uses GPIOs to set DIAG\_EN high to enable the diagnostics of one device, and disables the diagnostics of the other devices by setting DIAG\_EN low. Additionally, the device can keep power consumption to a minimum by setting DIAG\_EN and IN low.

Table 7-2 applies when the DIAG\_EN pin is enabled, and Table 7-3 applies when the DIAG\_EN pin is disabled.

Table 7-2. Fault Truth Table

CONDITION	IN	OUT	CRITERION	FAULT	FAULT RECOVERY
Normal	L	L	N/A	Н	N/A
Noma	Н	Н	N/A	Н	IN/A
Overload or short to GND	Н	L	current limit triggered	L	See Table 7-1.
Open load or short to battery	Н	Н	I <sub>OUT</sub> < I <sub>(ol,on)</sub>	L	FAULT clears when IN turns low for a duration longer than t FAULT. OR FAULT clears when the open load is removed.
Datter y	L(1)	Н	$V_{VS} - V_{OUT} < V_{(ol,off)}$	L	FAULT clears when IN is toggling OR FAULT clears when the open load is removed.
Thermal shutdown  H  N/A  Thermal shutdown triggered		L	FAULT clears when IN turns low for a duration longer than t FAULT. OR FAULT clears when thermal shutdown quits.		
Thermal swing	Н	N/A	Thermal swing triggered	L	FAULT clears when IN turns low for a duration longer than t FAULT. OR FAULT clears when thermal swing quits.

<sup>(1)</sup> An external pullup is required for open-load detection.

#### Table 7-3. DIAG\_EN Disabled Condition

DIAG_EN	IN CONDITION	PROTECTIONS AND DIAGNOSTICS				
LOW	ON	Diagnostics disabled, full protections				
LOW	OFF	Diagnostics disabled, no protection				

### 7.3.5 Full Diagnostics

#### 7.3.5.1 Short-to-GND and Overload Detection

When the output is on, a short-to-GND or overload condition causes an overcurrent. If the overcurrent triggers the internal or external current limit threshold, the fault condition is reported as  $\overline{\text{FAULT}}$  pin = low.

#### 7.3.5.2 Open-Load Detection

#### 7.3.5.2.1 Output On

When the output is on, the device recognizes an open-load fault if the current flowing through the output  $I_{OUT} < I_{(ol,on)}$ . For open-load detection when output is on, no external circuitry is required.

#### 7.3.5.2.2 Output Off

When the output is off, the output is pulled down to GND if a load is connected. But if an open load occurs, the output voltage is close to the supply voltage  $(V_{VS} - V_{OUT} < V_{(ol,off)})$ , and the device recognizes an open-load fault.

There is always a leakage current  $I_{(ol,off)}$  on the output due to the internal logic control path or external humidity, corrosion, and so forth. As a result, TI recommends using an external pullup resistor to offset the leakage current when an open load is detected. The recommended pullup resistance is 15 k $\Omega$ .

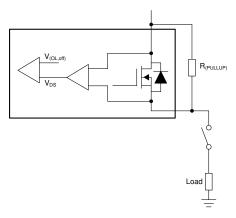

Figure 7-10. Open-Load Detection in Output OFF State

#### 7.3.5.3 Short-to-Battery Detection

Short-to-battery has the same detection mechanism and behavior as open-load detection in the ON state and the OFF state.

#### 7.3.5.4 Thermal Fault Detection

To protect the device in severe power stressing cases, the device implements two types of thermal fault detection, absolute temperature protection (thermal shutdown) and dynamic temperature protection (thermal swing).

Submit Document Feedback

Copyright © 2021 Texas Instruments Incorporated

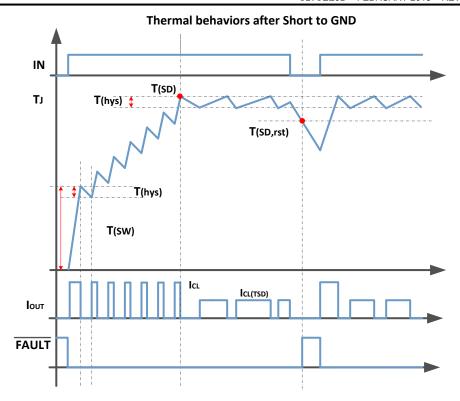

Figure 7-11. Thermal Behavior Diagram

#### 7.3.5.4.1 Thermal Shutdown

Thermal shutdown is active when the absolute temperature  $T_J > T_{(SD)}$ . When thermal shutdown occurs, the output turns off.

#### 7.3.5.4.2 Thermal Swing

Thermal swing activates when the power FET temperature sharply increases, that is, when  $\Delta T = T_{(FET)} - T_{(Logic)} > T_{(sw)}$ , then the output turns off. The output automatically recovers and the fault signal clears when  $\Delta T = T_{(FET)} - T_{(Logic)} < T_{(sw)} - T_{(hys)}$ . The thermal swing function improves the reliability of the device when subjected to repetitively fast thermal variation.

#### 7.3.5.4.3 Fault Report Holding

When using PWM dimming, FAULT is easily cleared by the PWM falling edge. Even if the fault condition remains all the time, FAULT is discontinuous. To avoid this unexpected fault report behavior, the device implements fault report holding time. Figure 7-12 shows an issue that typically occurs during PWM dimming, the FAULT is cleared unexpectedly even when the short-to-GND still exists. The TPS1H200A-Q1 device with fault-report holding function allows the right behavior as shown in Figure 7-13.

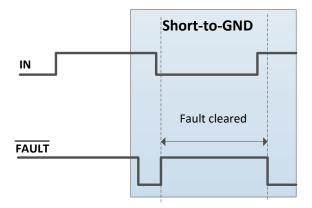

Figure 7-12. Without Fault-Report Holding

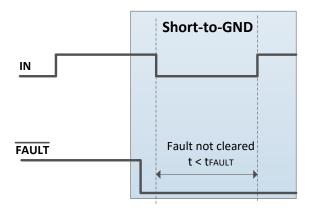

Figure 7-13. With Fault-Report Holding

#### 7.3.6 Full Protections

#### 7.3.6.1 UVLO Protection

The device monitors the supply voltage,  $V_{VS}$ , to prevent unpredicted behaviors when  $V_{VS}$  is too low. When  $V_{VS}$  drops down to  $V_{VS(uvr)}$ , the device shuts down. When  $V_{VS}$  rises up to  $V_{VS(uvr)}$ , the device turns on.

### 7.3.6.2 Inductive Load Switching Off Clamp

When an inductive load is switched off, the inductive reactance pulls the output voltage negative. However, excessive negative voltage can cause the power FET to break down. To protect the power FET from breaking down, an internal clamp  $(V_{DS(clamp)})$  is implemented.

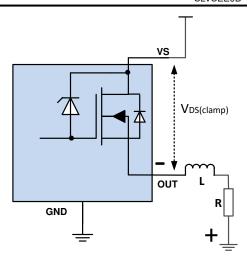

Figure 7-14. Drain-to-Source Clamping Structure

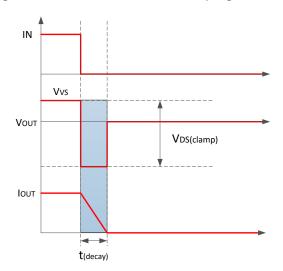

Figure 7-15. Inductive-Load Switching-Off Diagram

#### 7.3.6.3 Loss-of-GND Protection

When a loss-of-GND occurs, the output shuts down, regardless of whether the IN pin is high or low. The device can protect against two ground-loss conditions, loss of device GND and loss of module GND.

### 7.3.6.4 Loss-of-Power-Supply Protection

When a loss-of-power-supply occurs, the output shuts down, regardless of whether the IN pin is high or low. For a resistive or a capacitive load, the loss-of-power-supply has no risk. But for a charged inductive load, the current is driven from all the logic control pins to maintain the inductance current. To protect the system in this condition, TI recommends protection with an external free-wheeling diode.

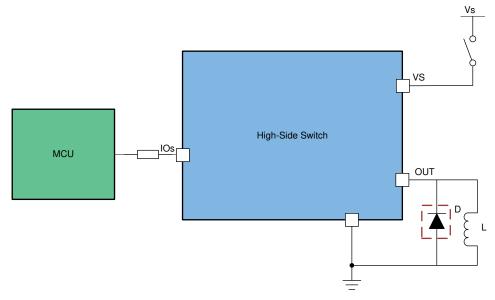

Figure 7-16. Protection for Loss of Power Supply

#### 7.3.6.5 Reverse-Current Protection

Reverse current occurs in two conditions: short to supply and reverse polarity.

- When a short to the supply occurs, there is only reverse current through the body diode. I<sub>R(1)</sub> specifies the limit of the reverse current.
- In a reverse-polarity condition, there are reverse currents through the body diode and the device GND pin.  $I_{R(2)}$  specifies the limit of the reverse current.

To protect the device, TI recommends using two types of external circuitry.

- Adding a blocking diode (method 1). The device and load are protected when in reverse polarity.
- Adding a GND network (method 2). The reverse current through the device GND is blocked. The reverse
  current through the FET is limited by the load itself. TI recommends a resistor in parallel with the diode as a
  GND network. The recommended configuration is a 1-kΩ resistor in parallel with a diode that is less than 100
  mA.

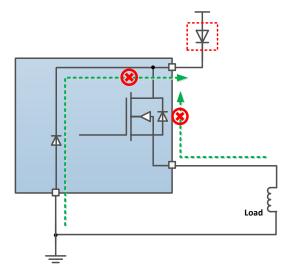

Figure 7-17. Reverse-Current External Protection Method 1

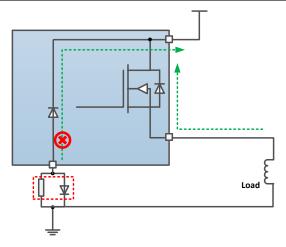

Figure 7-18. Reverse-Current External Protection Method 2

#### 7.3.6.6 MCU I/O Protection

TI recommends using series resistors to protect the microcontroller, for example, 4.7 k $\Omega$  when using a 3.3-V microcontroller and 10 k $\Omega$  for a 5-V microcontroller.

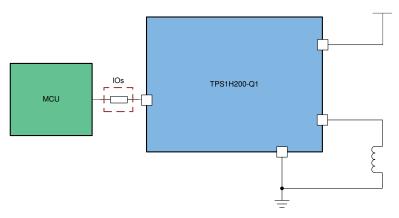

Figure 7-19. MCU I/O External Protection

#### 7.4 Device Functional Modes

### 7.4.1 Working Modes

The device has three working modes: the normal mode, the standby mode, and the standby mode with diagnostics, as shown in Figure 7-20.

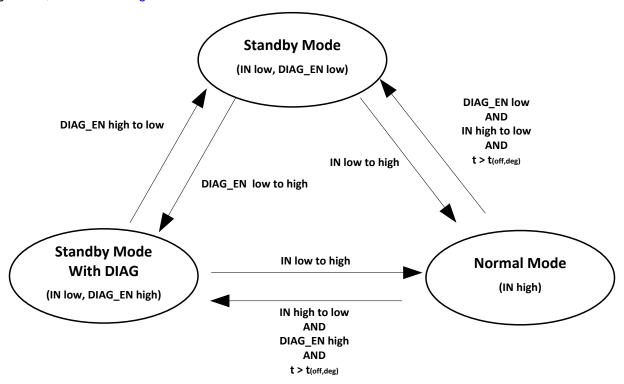

Figure 7-20. Working Modes

#### 7.4.1.1 Normal Mode

When IN is high, the device enters normal mode.

### 7.4.1.2 Standby Mode

When IN is low and DIAG\_EN is low, the device enters standby mode with ultra-low power consumption.

#### 7.4.1.3 Standby Mode With Diagnostics

When IN is low and DIAG\_EN is high, the device enters standby mode with diagnostics. The device still supports open-load and short-to-battery detection even when IN is low.

### 8 Application and Implementation

#### Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

#### 8.1 Application Information

The TPS1H200A-Q1 device is a smart high-side switch, with an internal charge pump and single-channel integrated NMOS power FET. The adjustable current limit function greatly improves the reliability of the whole system. Full diagnostic features enable intelligent control of the load. The TPS1H200A-Q1 device applies for a wide variety of resistive, inductive, and capacitive loads, including LEDs, relays, and submodules.

#### 8.2 Typical Application

Figure 8-1 shows an example of how to design the external circuitry parameters.

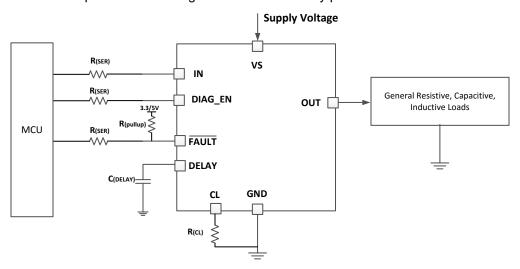

Figure 8-1. Typical Application Circuitry

### 8.2.1 Design Requirements

- V<sub>VS</sub> range from 6 V to 18 V
- · Nominal current of 500 mA
- Expected current limit value of 2 A
- Thermal sensitive system. When current limit occurs, the output latches off after 0.2 seconds. The 0.2 seconds is to ensure the safe start-up for a capacitive load, clamping the inrush current but without latch-off during start-up.
- Full diagnostics with 5-V MCU, including ON state open-load detection, short-to-GND, or overcurrent detection, and thermal shutdown detection

### 8.2.2 Detailed Design Procedure

To set the adjustable current limit value at 2 A, calculate R<sub>(CL)</sub> as follows:

$$R_{(CL)} = \frac{V_{CL(th)} \times K_{(CL)}}{I_{OUT}} = \frac{0.8 \times 2500}{2} = 1000 \Omega$$
 (3)

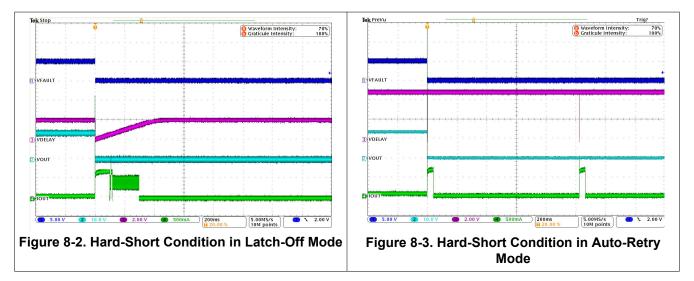

To set the adjustable latch-off delay at 0.2 s, calculate  $C_{(DELAY)}$  as follows:

$$\begin{split} t_{dl} &= t_{CL(deg)} + t_{dl1} + t_{dl2} = 0.2 \text{ w } t_{dl2} \\ C_{DELAY} &= \frac{I_{dl(chg)} \times t_{dl2}}{V_{dl(ref)}} = \frac{4.5 \times 0.2}{1.45} \times 10^{-6} = 0.62 \ \mu\text{F} \end{split} \tag{4}$$

TI recommends  $R_{(SER)}$  = 10 k $\Omega$  for a 5-V MCU, and  $R_{(pullup)}$  = 10 k $\Omega$  as the pullup resistor.

### 8.2.3 Application Curves

The following curves are test examples of hard-short conditions. The load is 0.1 A and the current limit value is 0.6 A. Figure 8-2 shows a waveform of the latch-off mode. Figure 8-3 shows a waveform of the auto-retry mode.

### 9 Power Supply Recommendations

The device applies to 12-V and 24-V applications. The normal power supply connection is a 12-V or 24-V system.

### 10 Layout

#### 10.1 Layout Guidelines

To prevent thermal shutdown, T<sub>J</sub> must be less than 175°C. If the output current is high, the power dissipation can be large. However, the PCB layout is very important. A good PCB design optimizes heat transfer, which is essential for the long-term reliability of the device.

- Maximize the copper coverage on the PCB to increase the thermal conductivity of the board. The major
  heat-flow path from the package to the ambient is through the copper on the PCB. Maximum copper is
  extremely important when no heat sinks are attached to the PCB on the other side of the board opposite the
  package.
- Add as many thermal vias as possible directly under the package ground pad to optimize the thermal conductivity of the board.
- All thermal vias must either be plated shut or plugged and capped on both sides of the board to prevent solder voids. To ensure reliability and performance, the solder coverage must be at least 85%.

### 11 Device and Documentation Support

### 11.1 Documentation Support

#### 11.1.1 Related Documentation

For related documentation see the following:

· Texas Instruments, TPS1H000-Q1 Evaluation Module (EVM) User's Guide

### 11.2 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. Click on *Subscribe to updates* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

### 11.3 Support Resources

TI E2E™ support forums are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

#### 11.4 Trademarks

PowerPAD™ and TI E2E™ are trademarks of Texas Instruments.

All trademarks are the property of their respective owners.

### 11.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

### 11.6 Glossary

TI Glossary

This glossary lists and explains terms, acronyms, and definitions.

### 12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. #### PACKAGING INFORMATION

Orderable part number	Status (1)	Material type	Package   Pins	Package qty   Carrier	<b>RoHS</b> (3)	Lead finish/ Ball material	MSL rating/ Peak reflow	Op temp (°C)	Part marking (6)
TPS1H200AQDGNRQ1	Active	Production	HVSSOP (DGN)   8	2500   LARGE T&R	Yes	NIPDAUAG	Level-2-260C-1 YEAR	-40 to 125	1EWX
TPS1H200AQDGNRQ1.A	Active	Production	HVSSOP (DGN)   8	2500   LARGE T&R	Yes	NIPDAUAG	Level-2-260C-1 YEAR	-40 to 125	1EWX

<sup>(1)</sup> Status: For more details on status, see our product life cycle.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

<sup>(2)</sup> Material type: When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

<sup>(3)</sup> RoHS values: Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

<sup>(4)</sup> Lead finish/Ball material: Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

<sup>(5)</sup> MSL rating/Peak reflow: The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

<sup>(6)</sup> Part marking: There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

# PowerPAD<sup>™</sup> HVSSOP - 1.1 mm max height

SMALL OUTLINE PACKAGE

#### NOTES:

PowerPAD is a trademark of Texas Instruments.

- 1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.

  2. This drawing is subject to change without notice.

  3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not
- exceed 0.15 mm per side.
- 4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm per side.
- 5. Reference JEDEC registration MO-187.

SMALL OUTLINE PACKAGE

NOTES: (continued)

- 6. Publication IPC-7351 may have alternate designs.
- 7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.
- 8. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.
- 9. Size of metal pad may vary due to creepage requirement.

SMALL OUTLINE PACKAGE

NOTES: (continued)

- 10. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
- 11. Board assembly site may have different recommendations for stencil design.
