

ADJUSTABLE BATTERY-BACKUP SUPERVISOR FOR RAM RETENTION

FEATURES

- Supply Current of 40 μA (Max)
- Battery Supply Current of 100 nA (Max)
- Supply Voltage Supervision Range:
 - Adjustable
 - Other Versions Available on Request
- Backup-Battery Voltage Can Exceed V_{DD}
- Power-On Reset Generator With Fixed 100-ms Reset Delay Time
- Active-High and Active-Low Reset Output
- Chip-Enable Gating: 3 ns (at $V_{DD} = 5\text{ V}$) Max Propagation Delay
- 10-Pin MSOP Package
- Temperature Range: -40°C to 85°C

APPLICATIONS

- Fax Machines
- Set-Top Boxes
- Advanced Voice Mail Systems
- Portable Battery-Powered Equipment
- Computer Equipment
- Advanced Modems
- Automotive Systems
- Portable Long-Time Monitoring Equipment
- Point-of-Sale Equipment

DESCRIPTION

The TPS3613-01 supervisory circuit monitors and controls processor activity by providing backup-battery switchover for data retention of CMOS RAM.

During power-on, reset ($\overline{\text{RESET}}$ and RESET) is asserted when the supply voltage (V_{DD} or V_{BAT}) becomes higher than 1.1 V.

Thereafter, the supply voltage supervisor monitors V_{DD} at the SENSE pin through external feedback resistors and keeps reset active as long as SENSE remains below the threshold voltage, V_{IT} .

An internal timer delays the release of the reset state to ensure proper system reset. The delay time starts after SENSE rises above the threshold voltage, V_{IT} .

When SENSE drops below V_{IT} , reset becomes active again.

The TPS3613-01 is available in a 10-pin MSOP package and is characterized for operation over a temperature range of -40°C to $+85^{\circ}\text{C}$.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

detailed description

backup-battery switchover

In case of a brownout or power failure, it may be necessary to preserve the contents of RAM. If a backup battery is installed at V_{BAT} , the device automatically switches the connected RAM to backup power when V_{DD} fails. In order to allow the backup battery (for example, 3.6-V lithium cells) to have a higher voltage than V_{DD} , these

supervisors do not connect V_{BAT} to V_{OUT} when V_{BAT} is greater than V_{DD} . V_{BAT} only connects to V_{OUT} (through a 15- Ω switch) when V_{DD} falls below V_{IT} and V_{BAT} is greater than V_{DD} . When V_{DD} recovers, switchover is deferred either until V_{DD} crosses V_{BAT} , or when V_{DD} rises above the reset threshold V_{IT} . V_{OUT} connects to V_{DD} through a 1- Ω (max) PMOS switch when V_{DD} crosses the reset threshold.

$V_{DD} > V_{BAT}$	$V_{DD} > V_{IT}$	V_{OUT}
1	1	V_{DD}
1	0	V_{DD}
0	1	V_{DD}
0	0	V_{BAT}

detailed description (continued)**chip-enable signal gating**

The internal gating of chip-enable ($\overline{CE}$) signals prevents erroneous data from corrupting CMOS RAM during an under-voltage condition. The TPS3613 uses a series transmission gate from $\overline{CEIN}$ to $\overline{CEOUT}$. During normal operation (reset not asserted), the CE transmission gate is enabled and passes all CE transitions. When reset is asserted, this path becomes disabled, preventing erroneous data from corrupting the CMOS RAM. The short CE propagation delay from $\overline{CEIN}$ to $\overline{CEOUT}$ enables the TPS3613 device to be used with most processors.

The CE transmission gate is disabled and $\overline{CEIN}$ is in high impedance (disable mode) while reset is asserted. During a power-down sequence when V_{DD} crosses the reset threshold, the CE transmission gate is disabled and $\overline{CEIN}$ immediately becomes high impedance if the voltage at $\overline{CEIN}$ is high. If $\overline{CEIN}$ is low when reset

is asserted, the CE transmission gate is disabled when $\overline{CEIN}$ goes high, or 15 μs after reset asserts, whichever occurs first. This allows the current write cycle to complete during power down. When the CE transmission gate is enabled, the impedance of $\overline{CEIN}$ appears as a resistor in series with the load at $\overline{CEOUT}$. The overall device propagation delay through the CE transmission gate depends on V_{OUT} , the source impedance of the drive connected to $\overline{CEIN}$, and the load at $\overline{CEOUT}$. To achieve minimum propagation delay, the capacitive load at $\overline{CEOUT}$ should be minimized, and a low-output-impedance driver is used.

In the disabled mode, the transmission gate is off and an active pullup connects $\overline{CEOUT}$ to V_{OUT} . This pullup turns off when the transmission gate is enabled.

**Figure 2. Chip-Enable Timing**

ABSOLUTE MAXIMUM RATINGS

OVER OPERATING FREE-AIR TEMPERATURE (unless otherwise noted)⁽¹⁾

Supply voltage: $V_{DD}^{(2)}$	7 V
MR and SENSE pins ⁽²⁾	–0.3 V to ($V_{DD} + 0.3$ V)
Continuous output current at V_{OUT} : I_O	400 mA
All other pins, I_O	±10 mA
Continuous total power dissipation	See Dissipation Rating Table
Operating free-air temperature range, T_A	–40°C to +85°C
Storage temperature range, T_{stg}	–65°C to +150°C
Lead temperature soldering 1,6 mm (1/16 inch) from case for 10 seconds	+260°C

(1) Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under recommended operating conditions is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) All voltage values are with respect to GND. For reliable operation the device must not operate at 7 V for more than $t = 1000$ h continuously.

DISSIPATION RATING TABLE

PACKAGE	$T_A \leq +25^\circ\text{C}$ POWER RATING	DERATING FACTOR ABOVE $T_A = +25^\circ\text{C}$	$T_A = +70^\circ\text{C}$ POWER RATING	$T_A = +85^\circ\text{C}$ POWER RATING
DGS	424 mW	3.4 mW/°C	271 mW	220 mW

RECOMMENDED OPERATING CONDITIONS

	MIN	MAX	UNIT
Supply voltage, V_{DD}	1.65	5.5	V
Battery supply voltage, V_{BAT}	1.5	5.5	V
Input voltage, V_I	0	$V_{DD} + 0.3$	V
High-level input voltage, V_{IH}	$0.7 \times V_{DD}$		V
Low-level input voltage, V_{IL}		$0.3 \times V_{DD}$	V
Continuous output current at V_{OUT} , I_O		300	mA
Input transition rise and fall rate at MR, $\Delta t/\Delta V$		100	ns/V
Slew rate at V_{DD} or V_{bat}		1	V/ μ s
Operating free-air temperature range, T_A	–40	+85	°C

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "-" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
