

TPS3762-Q1 SNVSCE6A - OCTOBER 2023 - REVISED MAY 2024

TPS3762-Q1 Automotive 65V Window (OV & UV) Supervisor with Built-In Self-Test and Latch

1 Features

- ASIL-D Functional Safety-Compliant
 - Documentation to aid ISO 26262 system design
 - Systematic capability up to ASIL-D
 - Hardware capability up to ASIL-D
- AEC-Q100 qualified for automotive applications
 - Device temperature grade 1: –40°C to +125°C
- Device flexibility to meet design requirements
 - Wide voltage threshold range: 2.7V to 60V
 - 800mV option use with external resistor divider to set threshold
 - Built-in hysteresis (2%, 5%, and 10% options)
 - Fixed and programmable reset time delay
 - Fixed and programmable detection delay
- Monitor high voltage power rails
 - Wide input voltage range: 2.7V to 65V
 - Reverse polarity protection on sense pin -65V
- Fast UV/OV protection in 12/24/48V systems
 - Output reset latching feature
 - Ultra-fast detection time delay option(5µs)
 - **Built-In Self-Test**

2 Applications

- Sensor fusion and cameras
- Digital cockpit processing unit
- On-board charger
- ADAS domain controller

3 Description

The TPS3762-Q1 is a 65V input voltage supervisor with 4µA I_{DD}, 0.9% accuracy, fast detection time (5µs), and a Built-In Self-Test feature. This device can be connected directly to 12V / 24V automotive battery systems for continuous monitoring of overvoltage (OV) and undervoltage (UV) conditions; with the internal resistor divider, the TPS3762-Q1 offers the smallest total solution size. Wide hysteresis voltage options are available to ignore large voltage transients and prevent false reset signals.

The separate VDD and SENSE pins redundancy sought by high-reliability systems and SENSE can monitor higher and lower voltages than VDD. Optional use of external resistors are supported by the high impedance input of the SENSE pin. CTS and CTR pins allow delay adjustability on the falling and rising edges of the RESET signal. The CTS functions as a debouncer by ignoring voltage glitches on the monitored voltage rails.

The TPS3762-Q1 is available in a 2.9mm × 1.6mm SOT23 8-pin package.

Device Information

PART NUMBER	PACKAGE (1)	BODY SIZE (NOM)
TPS3762-Q1	SOT-23 (8) (DDF)	2.9mm x 1.6mm

- For package details, see the mechanical drawing addendum at the end of the data sheet.
- The package size (length × width) is a nominal value and includes pins, where applicable.

4 Device Nomenclature

Device Decoder in Section 5 describe how to decode certain device function of the device based on its part number. Not all part numbers follow this nomenclature. Use Table 4-1 as the part number decoding table for all devices.

Table 4-1. Device Configuration Table

ORDERABLE PART NAME	Overvoltage (V _{ITP})	Overvoltage Hysteresis	Undervoltage (V _{ITN})	Undervoltage Hysteresis	CTR / CTS	Latch / UVbypass	BIST RESET Trigger
TPS3762D02OVDDFRQ1	800mV	2%	N/A	N/A	ADJ / ADJ	Both	Yes

5 Device Comparison

Device Decoder shows some of the device naming nomenclature of the TPS3762-Q1. Not all device namings follow this nomenclature table. For a detailed breakdown of every device part number by threshold voltage options, BIST configurations, Latch configurations, CTR options, CTS options, and UV bypass, see Section 4 for more details. Contact TI sales representatives or on TI's E2E forum for detail and availability of other options.

- 1. Suffix 02, 05, and 10 with VIT of 800mV corresponds to the adjustable variant, do not have internal voltage divider
- Not all TPS3762-Q1 devices can be decoded by this table. Refer to Section 4 for a decoding table by part number.

6 Pin Configuration and Functions

Figure 6-1. DDF Package, 8-Pin SOT-23, TPS3762-Q1 (Top View)

Table 6-1. Pin Functions

PIN		I/O	DESCRIPTION		
NAME	NAME NO.		DESCRIPTION		
VDD	1	I	Input Supply Voltage: Supply voltage pin. For noisy systems, bypass with a 0.1µF capacitor to GND.		
SENSE	2	I	Sense Voltage: Connect this pin to the supply rail that must be monitored. See Section 8.3.2 for more details. Sensing Topology: Overvoltage (OV) or Undervoltage (UV) or Window (OV + UV)		
GND	3 - Ground. Ground pin. All GND pins must be electrically		Ground. Ground pin. All GND pins must be electrically connected to the board ground.		
RESET	4	0	Output Reset Signal: RESET asserts when SENSE crosses the voltage threshold after the sense time delay, set by CTS, and remains asserted for the reset time delay period, set by CTR, after SENSE transitions out of a fault condition. For latch variants RESET remains asserted until the latch is cleared. The active low open-drain reset output requires an external pullup resistor. See Section 8.3.3.2 for more details. Output topology: Open-Drain Active-Low		
BIST	5	0	Built-In Self-Test: BIST asserts when a logic high input occurs on the BIST_EN / LATCH_CLR or BIST_EN pin, this initiates the internal BIST testing. BIST recovers after tbist to signify BIST completed successfully. BIST remains asserted for a time period longer than tbist if there is a failure during BIST. BIST active-low open-drain output requires an external pullup resistor. See Section 8.3.6 for more details.		
BIST_EN / LATCH_CLR	6	I	Built-in Self-test Enable and Latch Clear: A logic high input must occur on the BIST_EN / LATCH_CLR to initate BIST and clear a latched OV/UV fault. See Section 8.3.6 for more details.		
CTR 7 O capacitor for ad		0	RESET Time Delay: User-programmable reset time delay for RESET. Connect an external capacitor for adjustable time delay or leave the pin floating for the shortest delay. See Section8.3.4 for more details.		
стѕ	SENSE Time Delay: User-program		SENSE Time Delay: User-programmable sense time delay for SENSE. Connect an external capacitor for adjustable time delay or leave the pin floating for the shortest delay. See Section 8.3.5 for more details.

9 Typical Characteristics (continued)

Typical characteristics show the typical performance of the TPS3762-Q1 device. Test conditions are taken at $T_A = 25$ °C, unless otherwise noted.

10 Detailed Description

10.1 Overview

The TPS3762-Q1 is a family of high voltage and low quiescent current voltage supervisors with overvoltage and undervoltage threshold voltage options, delay timings, Built-In Self-Test, and latch. The TPS3762-Q1 over and undervoltage thresholds are device specific and are offered in either adjustable thresholds or fixed threholds. The adjustable threshold option uses an external resistor ladder to make a voltage divider on SENSE pin which uses the internal 800mV threshold to trigger overvoltage and undervoltage faults. The benefit of using an adjustable option with external resistors is the faster reaction speed compared to a fixed internal threshold variant. The TPS3762-Q1 fixed threshold option utilizes an integrated voltage divider to eliminate the need for external resistors and provides a lower system leakage current.

VDD, SENSE and RESET pins can support 65V continuous operation. SENSE has -65V reverse polarity protection. VDD, SENSE, and RESET voltage levels can be independent of each other. TPS3762-Q1 includes a reset output latching feature that holds the output active to help system achieve safe state. Fixed and programmable sense and reset delay are available to avoid false resets and false reset releases.

10.2 Functional Block Diagram

Figure 10-1. Fixed Threshold Functional Block Diagram

Figure 10-2. Adjustable Threshold Functional Block Diagram

Product Folder Links: TPS3762-Q1

10.3 Feature Description

10.3.1 Input Voltage (VDD)

VDD operating voltage ranges from 2.7V to 65V. An input supply capacitor is not required for this device; however, if the input supply is noisy good analog practice is to place a $0.1\mu F$ capacitor between the VDD and GND.

VDD needs to be at or above $V_{DD(MIN)}$ for at least the start-up time delay (t_{SD}) for the device to be fully functional.

VDD voltage is independent of V_{SENSE} and V_{RESET} , meaning that VDD can be higher or lower than the other pins.

10.3.1.1 Undervoltage Lockout (V_{POR} < V_{DD} < UVLO)

When the voltage on V_{DD} is less than the UVLO voltage, but greater than the power-on reset voltage (V_{POR}), the RESET and BIST pins will be asserted, regardless of the voltage at SENSE pin.

10.3.1.2 Power-On Reset ($V_{DD} < V_{POR}$)

When the voltage on VDD is lower than the power on reset voltage (V_{POR}), the output signal is undefined and is not to be relied upon for proper device function.

Note: Figure 10-3 and Figure 10-4 assume an external pull-up resistor is connecting the RESET pin to VDD.

Figure 10-3. Power Cycle (SENSE Outside of Nominal Voltage)

Figure 10-4. Power Cycle (SENSE Within Nominal Voltage)

10.3.2 SENSE

The SENSE pin connects to the supply rail that is to be monitored. The sense pin on each device is configured to monitor either overvoltage (OV), undervoltage (UV), or window (OV&UV) conditions. TPS3762-Q1 device offers built-in hysteresis that provides noise immunity and maintains stable operation.

Although not required in most cases, for noisy applications where t_{CTS} is not sufficient glitch rejection, good analog design practice is to place a 10nF to 100nF bypass capacitor at the SENSE input to reduce sensitivity to transient voltages on the monitored signal. SENSE can be connected directly to VDD pin.

10.3.2.1 Reverse Polarity Protection

The TPS3762-Q1 has reverse polarity protection on the sense pin up to -65V. This allows the TPS3762-Q1 to support accidental or test simulated reverse connections without damaging the device. This protection permits the TPS3762-Q1 to connect directly off of the supply prior to any reverse polarity protection diodes for accurate voltage measurement.

10.3.2.2 SENSE Hysteresis

TPS3762-Q1 device offers built-in hysteresis around the UV and OV thresholds to avoid erroneous $\overline{\text{RESET}}$ deassertions. The hysteresis is opposite to the threshold voltage; for overvoltage options the hysteresis is subtracted from the positive threshold (V_{ITP}), for undervoltage options hysteresis is added to the negative threshold (V_{ITN}).

Submit Document Feedback

Table 10-1. Common Adjustable Hysteresis Lookup Table

	TARGET				
ADJUSTABLE THRESHOLD	TOPOLOGY	RELEASE VOLTAGE (V)	DEVICE HYSTERESIS OPTION		
800mV	Overvoltage	784mV	-2%		
800mV	Overvoltage	760mV	-5%		
800mV	Overvoltage	720mV	-10%		
800mV	Undervoltage	816mV	2%		
800mV	Undervoltage	840mV	5%		
800mV	Undervoltage	880mV	10%		

Table 10-1 shows a sample of hysteresis for the 800mV adjustable variant of TPS3762-Q1.

Knowing the amount of hysteresis voltage, the release voltage for the undervoltage (UV) channel is $(V_{ITN} + V_{HYS})$ and for the overvoltage (OV) channel is $(V_{ITP} - V_{HYS})$.

Undervoltage (UV)

 $V_{ITN} = 800 \text{mV}$

Voltage Hysteresis (V_{HYS}) = 2% = 16mV

Hysteresis Accuracy = +1.5% to +2.5% = 16.24mV to 16.4mV

Release Voltage = V_{ITN} + V_{HYS} = 816.24mV to 816.4mV

Overvoltage (OV)

 $V_{ITP} = 800 mV$

Voltage Hysteresis (V_{HYS}) = 2% = 16mV

Hysteresis Accuracy = +1.5% to +2.5% = 16.24mV to 16.4mV

Release Voltage = V_{ITP} - V_{HYS} = 783.6mV to 783.76mV

10.3.3 Output Logic Configurations

TPS3762-Q1 is a single channel device that has a single input SENSE pin and a single RESET pin. The single RESET is available only with open drain topology.

10.3.3.1 Open-Drain

Open-drain output requires an external pull-up resistor to hold the voltage high to the required voltage logic. Connect the pull-up resistor to the proper voltage rail to enable the output to be connected to other devices at the correct interface voltage levels.

To select the right pull-up resistor consider system V_{OH} and the Open-Drain Leakage Current (I_{lkg}) provided in the electrical characteristics, high resistors values will have a higher voltage drop affecting the output voltage high. The open-drain output can be connected as a wired-AND logic with other open-drain signals such as another TPS3762-Q1 open-drain output pin.

10.3.3.2 Active-Low (RESET)

RESET (active low) denoted with a bar above the pin label. RESET remains high voltage (V_{OH}, deasserted) as long as sense voltage is in normal operation within the threshold boundaries and VDD voltage is above UVLO. To assert a reset sense pins needs to meet the condition below:

- For undervoltage the SENSE voltage need to cross the lower boundary (V_{ITN}).
- For overvoltage the SENSE voltage needs to cross the upper boundary (V_{ITP}).

Copyright © 2024 Texas Instruments Incorporated

Submit Document Feedback

10.3.3.3 Latching

The TPS3762-Q1 comes with the optional output reset latching feature, check the Section 5 to verify variant specific latch functionality. When using a variant with latch enabled ($V_{BIST_EN/LATCH_CLR}$ <0.5V), whenever a fault, OV or UV, occurs RESET asserts and goes low and remains low until cleared by a logic high input ($V_{BIST_EN/LATCH_CLR} > 1.3V$) on the BIST_EN / LATCH_CLR pin. If the SENSE pin is in a safe region and latch is disabled, the RESET deasserts after a delay. This delay is dependent on BIST and CTR timing. See Section 10.3.6 for more details. While $V_{BIST_EN/LATCH_CLR} > 1.3V$, the device is in latch disabled mode and the RESET does not latch for OV and UV on SENSE pin. While the device is in latch disabled mode the RESET asserts for OV and UV faults. When $V_{BIST_EN/LATCH_CLR} < 0.5V$, latch mode is enabled.

Figure 10-6. RESET Latch & Unlatch

10.3.3.4 UVBypass

The TPS3762-Q1 comes with the optional undervoltage bypass (UVbypass) feature, check Section 5 to verify variant specific UVbypass functionality. When using a variant with UVbypass enabled, the first undervoltage event after $V_{DD} > V_{POR}$ is ignored. In cases where an undervoltage event has not occurred UVbypass can be cleared by running BIST.

UVbypass is targeted at specific applications in which the TPS3762-Q1 is powered Off-battery and is monitoring the Off-battery DC-DC output, as shown in Figure 10-7. If the Off-battery DCDC output is outside of threshold the TPS3762-Q1 resets this device. See Figure 10-8 and Figure 10-9 for more details.

Figure 10-7. UVbypass Schematic

Figure 10-8. UVbypass Enabled

Figure 10-9. UVbypass Disabled

10.3.4 User-Programmable Reset Time Delay

TPS3762-Q1 has adjustable reset release time delay with external capacitors.

- A capacitor on CTR programs the reset time delay of the output.
- No capacitor on this pin gives the fastest reset delay time indicated by t_{CTR} in Section 7.6.
- Variants such as TPS3762Q use a fixed internal time delay, check the Section 5 to verify variant specific timing.

10.3.4.1 Reset Time Delay Configuration

RESET time delay (t_{CTR}) occurs when the \overline{RESET} is transitioning from a fault state (V_{OL}) to a non-fault state (V_{OH}). The time delay (t_{CTR}) can be programmed by connecting a capacitor between CTR pin and GND. For situations with a fault on SENSE after \overline{RESET} recovers, the TPS3762-Q1 makes sure that the CTR capacitor is fully discharged before starting the recovery sequence. This makes sure that the programmed CTR time is maintained for consecutive faults.

The relationship between external capacitor C_{CTR} EXT (typ) and the time delay t_{CTR} (typ) is given by Equation 1.

$$t_{\text{CTR (typ)}} = R_{\text{CTR (typ)}} \times C_{\text{CTR_EXT (typ)}} + t_{\text{CTR (no cap)}} \times 10^{-6}$$
(1)

 $R_{CTR (typ)} = is in mega ohms (M\Omega)$

 $C_{CTR\ EXT\ (typ)}$ = is given in microfarads (μF)

t_{CTR (typ)} = is the reset time delay/delays

The reset delay varies according to three variables: the external capacitor (C_{CTR_EXT}), CTR pin internal resistance (R_{CTR}) provided in Section 7.5, and the constant (t_{CTR} (no cap)) provided in Section 7.6. The minimum and maximum variance due to the constant is show in Equation 2 and Equation 3:

$$t_{\text{CTR (min)}} = R_{\text{CTR (min)}} \times C_{\text{CTR_EXT (min)}} + t_{\text{CTR (no cap (min))}} \times 10^{-6}$$
(2)

$$t_{\text{CTR (max)}} = R_{\text{CTR (max)}} \times C_{\text{CTR_EXT (max)}} + t_{\text{CTR (no cap (max))}} \times 10^{-6}$$
(3)

There is no limit to the capacitor on CTR pin. Having a too large of a capacitor value can cause very slow charge up (rise times) due to capacitor leakage and system noise can cause the internal circuit to hold RESET active.

* Leakages on the capacitor can effect accuracy of reset time delay.

10.3.5 User-Programmable Sense Delay

TPS3762-Q1 has adjustable sense release time delay with external capacitors.

- A capacitor on CTS programs the sense time delay of the input.
- No capacitor on this pin gives the fastest sense delay time indicated by t_{CTS} in Section 7.7.
- The TPS3762-Q1 comes with an optional fixed internal time delay that ignores the capacitor value at the CTS pin, check the Section 5 to verify variant specific functionality.

10.3.5.1 Sense Time Delay Configuration

SENSE time delay (t_{CTS}) occurs when the \overline{RESET} is transitioning from a non-fault state (V_{OH}) to a fault state (V_{OH}) . The time delay (t_{CTS}) can be programmed by connecting a capacitor between CTS pin and GND.

The relationship between external capacitor C_{CTS} EXT (tvp) and the time delay t_{CTS} (tvp) is given by Equation 4.

$$t_{\text{CTS (typ)}} = R_{\text{CTS (typ)}} \times C_{\text{CTS_EXT (typ)}} + t_{\text{CTS (no cap)}} \times 10^{-6}$$
(4)

 $R_{CTS (typ)}$ = is in mega ohms (M Ω)

 $C_{CTS EXT (typ)}$ = is given in microfarads (μF)

 $t_{CTS (typ)}$ = is the sense time delay/delays

The sense delay varies according to three variables: the external capacitor (C_{CTS_EXT}), CTS pin internal resistance (R_{CTS}) provided in Section 7.5, and the constant (t_{CTS} (no cap)) provided in Section 7.6. The minimum and maximum variance due to the constant is show in Equation 5 and Equation 6:

$$t_{\text{CTS (min)}} = R_{\text{CTS (min)}} \times C_{\text{CTS EXT (min)}} + t_{\text{CTS (no cap (min))}} \times 10^{-6}$$
(5)

$$t_{\text{CTR (max)}} = R_{\text{CTS (max)}} \times C_{\text{CTS EXT (max)}} + t_{\text{CTSx (no cap (max))}} \times 10^{-6}$$
(6)

The recommended maximum sense delay capacitor for the TPS3762-Q1 is 10µF as this makes sure there is enough time for the capacitor to fully discharge when a voltage fault occurs. Also, having a too large of a capacitor value can cause very slow charge up (rise times) and system noise can cause the internal circuit to trip unpredictably. This leads to a variation in time delay where the delay accuracy can be worse in the presence of system noise.

* Leakages on the capacitor can effect accuracy of sense time delay.

Submit Document Feedback

10.3.6 Built-In Self-Test

The TPS3762-Q1 has a Built-In Self-Test (BIST) feature that runs diagnostics internally in the device. During power-up BIST is initiated automatically after crossing $V_{DD(min)}$. During BIST the \overline{BIST} pin and \overline{RESET} output asserts low and deasserts if the \overline{BIST} test completes successfully indicating no internal faults in the device. The length of the BIST and \overline{BIST} assertion is specified by $t_{\overline{BIST}}$. If BIST is not successful, the \overline{BIST} pin will say asserted low signifying an internal fault. The \overline{RESET} output will stay assert on \overline{BIST} failure. During BIST, the device is not monitoring the SENSE pin for faults and the \overline{RESET} is not dependent on the SENSE pin voltage. The \overline{BIST} sequence of internal tests verifies the internal signal chain of the device by checking for faults on the internal comparators on the SENSE pin, bandgap voltage, and the \overline{RESET} output. See Figure 10-10 for more details.

Figure 10-10. TPS3762-Q1 Start-Up Sequence

After a successful power-up sequence, BIST can be initiated any time with a logic high input (V_{BIST_EN} or $V_{BIST_EN/LATCH_CLR} > 1.3V$) on the BIST_EN / LATCH_CLR pin. BIST initiates and the \overline{BIST} pin asserts only if the SENSE pin is not in a overvoltage or undervoltage fault mode. During this BIST test time period, $t_{\overline{BIST}}$, \overline{BIST} pin asserts low to signify that \overline{BIST} has started and \overline{RESET} assertion is dependent on the device variant. Upon a successful BIST the \overline{BIST} pin and \overline{RESET} pin are deasserted. If BIST is not successful due to an internal device not working properly, the \overline{RESET} pin and \overline{BIST} pin remain asserted low signifying a fault internal to the device. See Figure 10-11 and Figure 10-12 for more details.

11 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

11.1 Application Information

The following sections describe in detail proper device implementation, depending on the final application requirements.

11.2 Adjustable Voltage Thresholds

Figure 11-1 illustrates an example of how to adjust the voltage threshold with external resistor dividers. The resistors can be calculated depending on the desired voltage threshold and device part number. TI recommends using the adjustable (0.8V voltage threshold device) when setting adjustable voltage thresholds. This variant bypasses the internal resistor ladder.

For example, consider a 12V rail, V_{MON} , being monitored for overvoltage (OV) using of the TPS3762D02OVDDFRQ1 variant, as shown in Figure 11-1. The monitored OV threshold, denoted as V_{MON+} , is the desired voltage where the device asserts the reset. For this example $V_{MON+} = 35V$. To assert an overvoltage reset the voltage at the sense pin, V_{SENSE} , needs to be equal to the input threshold positive, V_{ITP} . For this example variant $V_{SENSE} = V_{ITP} = 0.8V$. Using R_1 and R_2 the correlation between V_{MON+} and V_{SENSE} can be seen in Equation 8. Assuming $R_2 = 10k\Omega$, and R_1 can be calculated as $R_1 = 427.5k\Omega$.

$$V_{SENSE} = V_{MON+} \times (R_2 \div (R_1 + R_2))$$
 (7)

The TPS3762D02OVDDFRQ1 comes with variant specific 2%, 5%, or 10% voltage threshold hysteresis. For the reset signal to become deasserted, V_{MON} must go below V_{ITP} - V_{HYS} . For this example variant a 2% voltage threshold hysteresis was selected. Therefore, V_{MON} equals 34.3V when the reset signal becomes deasserted.

There are inaccuracies that must be taken into consideration while adjusting voltage thresholds. Aside from the tolerance of the resistor divider, there is the internal resistance of the SENSE pin that can affect the accuracy of the resistor divider. Although expected to be very high impedance, users are recommended to calculate the values for the design specifications. The internal SENSE resistance (R_{SENSE}) can be calculated by the SENSE voltage (V_{SENSE}) divided by the SENSE current (I_{SENSE}) as shown in Equation 9. V_{SENSE} can be calculated using Equation 7 depending on the resistor divider and monitored voltage. I_{SENSE} can be calculated using Equation 8.

$$I_{SENSE} = [(V_{MON} - V_{SENSE}) \div R_1] - (V_{SENSE} \div R_2)$$
(8)

$$R_{SENSE} = V_{SENSE} \div I_{SENSE}$$
 (9)

Figure 11-1. Adjustable Voltage Threshold with External Resistor Dividers

11.3 Typical Application

11.3.1 Design 1: Off-Battery Monitoring

This application is intended for the initial power stage in applications with the 12V batteries. The TPS3762-Q1 utilizes high-voltage SENSE and V_{DD} inputs to monitor an automotive battery.

Figure 11-6 illustrates an example of how the TPS3762-Q1 is monitoring the battery voltage while being powered by it, as well.

Figure 11-2. Off-Battery Monitoring

Submit Document Feedback

11.3.1.1 Design Requirements

Table 11-1. Design Parameters

PARAMETER	DESIGN REQUIREMENT			
Voltage Threshold	Typical OV voltage threshold 30V.			
Maximum Input Power	Operate with power supply input up to 65V			
Output Logic	Open-Drain			
SENSE Delay	>100ms			
RESET Delay	>300ms			
Output Features	Output latching and built-in self-test			

11.3.1.2 Detailed Design Procedure

The TPS3762-Q1 utilizes high-voltage SENSE and V_{DD} inputs to monitor an automotive battery. In this design example TPS3762D02OVDDFRQ1 is used.

11.3.1.2.1 Setting Voltage Threshold

The positive-going threshold voltage, V_{ITP} , is set by the device variant. In this example, the nominal supply voltage from the battery is 12V. Setting a overvoltage threshold of 30V makes sure that the device resets before supply voltage violates the allowed boundary. The adjustable voltage variant is chosen and R_1 and R_2 are adjusted to meet the threshold. Assuming R_2 equal to $10k\Omega$ and R_1 is calculated as $365k\Omega$. For additional information on selecting resistor values see Section 11.2. TPS3762-Q1 also supports fixed voltage threshold variants. Threshold voltage decoding can be found in Device Decoder.

11.3.1.2.2 Meeting the Sense and Reset Delay

The TPS3762-Q1 features both reset assertion (sense) delay, t_{CTS} , and reset deassertion (reset) delay, t_{CTR} . The TPS3762-Q1 features two options for selecting sense and reset delays: fixed delays and capacitor-programmable delays. For the device variant used in this design, TPS3762D02OVDDFRQ1, the capacitor-programmable delay is chosen. Section 10.3.5 and Section 10.3.4 show how to set the timings for the capacitor-programmable delays. The application requires greater than 100 ms sense delay, thus a 0.033 μ F capacitor is used. The application requires greater than 300 ms reset delay, thus a 0.1 μ F capacitor is used.

11.3.1.2.3 Setting Supply Voltage

Setting the supply voltage is done by connecting the V_{DD} input directly to the battery rail without the need for external circuitry. The device being able to handle 65V on V_{DD} means the monitored voltage rail can handle any voltage transience up to 65V. Good analog design practice recommends using a 0.1 μ F capacitor on the V_{DD} pin.

11.3.1.2.4 Initiating Built-In Self-Test and Clearing Latch

Built-In Self-Test (BIST) is asserted on device power-up, as outlined in Figure 10-10. BIST can also be initiated any time by a rising edge that crosses the voltage logic high input (V_{BIST_EN} or $V_{BIST_EN/LATCH_CLR} > 1.3V$) on the BIST_EN / LATCH_CLR pin, as outlined in Figure 10-11. Output reset latching is set by the device variant. For the device variant used in this design, TPS3762D02OVDDFRQ1, the output has latch. Device specific output reset latching feature can be found in Device Decoder. To clear the latch a logic high input on the BIST_EN / LATCH_CLR pin is required. When clearing latch, BIST is initiated and the RESET returns logic level high once $t_{BIST_FCOVER} + t_{CTR}$ has expired, outlined in Figure 10-6. While $v_{BIST_EN/LATCH_CLR} > 1.3v$, the device is in latch disabled mode and the RESET does not latch for OV and UV on SENSE pin. While the device is in latch disabled mode the RESET still asserts for OV and UV faults.

11.4 Power Supply Recommendations

TPS3762-Q1 is designed to operate from an input supply with a V_{DD} voltage between 2.7V (minimum operation) to 65V (maximum operation). Good analog design practice recommends placing a minimum 0.1 μ F ceramic capacitor as near as possible to the V_{DD} pin.

11.4.1 Power Dissipation and Device Operation

The permissible power dissipation for any package is a measure of the capability of the device to pass heat from the power source, the junctions of the IC, to the ultimate heat sink, the ambient environment. Thus, the power dissipation is dependent on the ambient temperature and the thermal resistance across the various interfaces between the die junction and ambient air.

The maximum continuous allowable power dissipation for the device in a given package can be calculated using Equation 10:

$$P_{D-MAX} = \left(\left(T_{J-MAX} - T_A \right) / R_{\theta JA} \right) \tag{10}$$

The actual power being dissipated in the device can be represented by Equation 11:

$$P_{D} = V_{DD} \times I_{DD} + p_{RESET}$$
 (11)

p_{RESET} is calculated by Equation 12 or Equation 13

$$p_{RESET (PUSHPULL)} = V_{DD} - V_{RESET} \times I_{RESET}$$
 (12)

$$p_{RESET (OPEN-DRAIN)} = V_{RESET} \times I_{RESET}$$
 (13)

Equation 10 and Equation 11 establish the relationship between the maximum power dissipation allowed due to thermal consideration, the voltage drop across the device, and the continuous current capability of the device. These two equations must be used to determine the optimum operating conditions for the device in the application.

In applications where lower power dissipation (P_D) and/or excellent package thermal resistance ($R_{\theta JA}$) is present, the maximum ambient temperature (T_{A-MAX}) can be increased.

In applications where high power dissipation and/or poor package thermal resistance is present, the maximum ambient temperature (T_{A-MAX}) may have to be de-rated. T_{A-MAX} is dependent on the maximum operating junction temperature ($T_{J-MAX-OP} = 125$ °C), the maximum allowable power dissipation in the device package in the application (P_{D-MAX}), and the junction-to ambient thermal resistance of the part/package in the application ($R_{\theta JA}$), as given by Equation 14:

$$T_{A-MAX} = (T_{J-MAX-OP} - (R_{\theta JA} \times P_{D-MAX})) \tag{14}$$

11.5 Layout

11.5.1 Layout Guidelines

- Make sure that the connection to the VDD pin is low impedance. Good analog design practice is to place a
 greater than 0.1µF ceramic capacitor as near as possible to the VDD pin.
- To further improve the noise immunity on the SENSE pins, placing a 10nF to 100nF capacitor between the SENSE pin and GND can reduce the sensitivity to transient voltages on the monitored signal.
- If a capacitor is used on CTS or CTR, place these components as close as possible to the respective pins. If the capacitor adjustable pins are left unconnected, make sure to minimize the amount of parasitic capacitance on the pins to less than 5pF.
- Place the pull-up resistors on RESET as close to the pin as possible.
- When laying out metal traces, separate high voltage traces from low voltage traces as much as possible.
 If high and low voltage traces need to run close by, spacing between traces must be greater than 20mils (0.5mm).

Submit Document Feedback

www.ti.com

Do not have high voltage metal pads or traces closer than 20 mils (0.5mm) to the low voltage metal pads or traces.

11.5.2 Layout Example

The layout example in Figure 11-6 shows how the TPS3762-Q1 is laid out on a printed circuit board (PCB) with user-defined delays.

12.2 Support Resources

TI E2E[™] support forums are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

12.3 Trademarks

TI E2E™ is a trademark of Texas Instruments.

All trademarks are the property of their respective owners.

12.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

- 7. Board assembly site may have different recommendations for stencil design.

IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATASHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES "AS IS" AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for skilled developers designing with TI products. You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, regulatory or other requirements.

These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource. Other reproduction and display of these resources is prohibited. No license is granted to any other TI intellectual property right or to any third party intellectual property right. TI disclaims responsibility for, and you fully indemnify TI and its representatives against any claims, damages, costs, losses, and liabilities arising out of your use of these resources.

TI's products are provided subject to TI's Terms of Sale, TI's General Quality Guidelines, or other applicable terms available either on ti.com or provided in conjunction with such TI products. TI's provision of these resources does not expand or otherwise alter TI's applicable warranties or warranty disclaimers for TI products. Unless TI explicitly designates a product as custom or customer-specified, TI products are standard, catalog, general purpose devices.

TI objects to and rejects any additional or different terms you may propose.
