

TPS65631W Dual-Output AMOLED Display Power Supply

1 Features

- 2.9-V to 4.5-V Input Voltage Range
- Fixed 4.6-V Positive Output Voltage
- 0.5% V_{POS} Accuracy from 25°C to 85°C
- Separate V_{POS} Output Sense Pin
- Negative Output Voltage Digitally Programmable from -1.4 V to -4.4 V (-4 V Default)
- Output Currents up to 200 mA Supported
- Excellent Line Transient Regulation
- Outputs High Impedance During Shut Down
- Short-Circuit Protection
- Thermal Shutdown
- Available in 2.5-mm x 2.5-mm, 10-Pin QFN Package

2 Applications

AMOLED Displays

3 Description

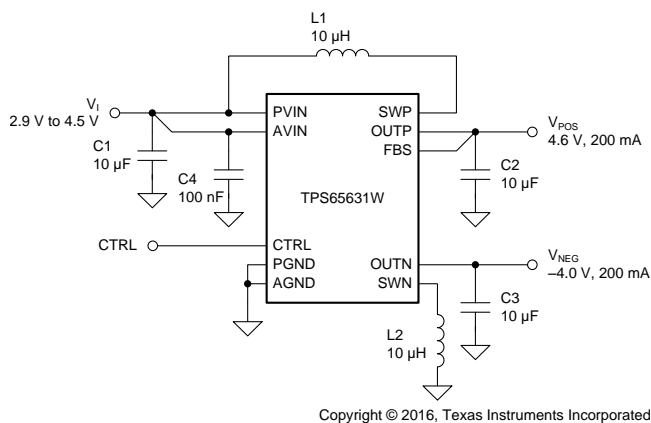

The TPS65631W is designed to drive AMOLED (Active Matrix Organic Light Emitting Diode) displays requiring positive and negative supply rails. The device integrates a boost converter for V_{POS} and an inverting buck boost converter for V_{NEG} and is suitable for battery-operated products. The digital control pin (CTRL) allows programming the negative output voltage in digital steps. The TPS65631W uses a novel technology enabling excellent line transient performance.

8 Detailed Description

8.1 Overview

The TPS65631W consists of a boost converter and an inverting buck boost converter. The V_{POS} output is fixed at 4.6 V and V_{NEG} output is programmable via a digital interface in the range of $-1.4\text{ V} \sim -4.4\text{ V}$, the default is -4 V .

8.2 Functional Block Diagram

Copyright © 2016, Texas Instruments Incorporated

8.3 Feature Description

8.3.1 Boost Converter

The boost converter uses a fixed-frequency current-mode topology, and its output voltage (V_{POS}) is fixed at 4.6 V. For the highest output voltage accuracy, connect the output sense pin (FBS) directly to the positive pin of the output capacitor. If not used, the FBS pin can be left floating or connected to ground. If the FBS pin is not used, the boost converter senses its output voltage using the OUTP pin.

8.3.2 Inverting Buck-Boost Converter

The inverting buck-boost converter uses a constant-off-time peak-current mode topology. The converter's default output voltage (V_{NEG}) is -4 V , but it can be programmed to any voltage in the range -1.4 V to -4.4 V (see [Programming \$V_{NEG}\$](#)).

Feature Description (continued)

8.3.3 Soft-Start and Start-Up Sequence

The TPS65631W features a soft-start function to limit inrush current. When the device is enabled by a high-level signal applied to the CTRL pin, the boost converter starts switching with a reduced switch current limit. Ten milliseconds after the CTRL pin goes high, the inverting buck-boost converter starts with a default value of -4 V. A typical start-up sequence is shown in Figure 6.

Figure 6. Start-Up Sequence

8.3.4 Enable (CTRL)

The CTRL pin serves two functions. One is to enable and disable the device, and the other is to program the output voltage (V_{NEG}) of the inverting buck-boost converter (see [Programming \$V_{NEG}\$](#)). If the digital interface is not required, the CTRL pin can be used as a standard enable pin for the device, which will come up with its default value on V_{NEG} of -4 V. When CTRL is pulled high, the device is enabled. The device is shut down with CTRL low.

8.3.5 Undervoltage Lockout

The TPS65631W features an undervoltage lockout function that disables the device when the input supply voltage is too low for normal operation.

8.3.6 Short Circuit Protection

The TPS65631W is protected against short-circuits of V_{POS} and V_{NEG} to ground and to each other.

8.3.6.1 Short-Circuits During Normal Operation

During normal operation an error condition is detected if V_{POS} falls below 4.1 V for more than 3 ms or V_{NEG} is pulled above the programmed nominal output by 500 mV for longer than 3 ms. In either case the device enters shutdown mode: the converters are disabled and their outputs are disconnected from the input. To resume normal operation either cycle the input supply voltage or toggle the CTRL pin low and then high again.

8.3.6.2 Short-Circuits During Start-Up

During start up an error condition is detected if:

- V_{POS} is not in regulation 10 ms after a high-level is applied to the CTRL pin.
- V_{NEG} is higher than threshold level 10 ms after a high-level is applied to the CTRL pin.
- V_{NEG} is not in regulation 20 ms after a high-level is applied to the CTRL pin.

To resume normal operation either cycle the input supply voltage or toggle the CTRL pin low and then high again.

Feature Description (continued)

8.3.7 Thermal Shutdown

The TPS65631W enters thermal shutdown mode if its junction temperature exceeds 145°C (typical). During thermal shutdown mode none of the device functions are available. To resume normal operation, either cycle the input supply voltage or toggle the CTRL pin low and then high again.

8.4 Device Functional Modes

8.4.1 Operation with $V_I < 2.9\text{ V}$

The recommended minimum input supply voltage for full performance is 2.9 V. The device continues to operate with input supply voltages below 2.9 V; however, full performance is not guaranteed. The device does not operate with input supply voltages below the UVLO threshold.

8.4.2 Operation with $V_I \approx V_{POS}$ (Diode Mode)

The TPS65631W features a "diode" mode that enables it to regulate its output voltage even when the input supply voltage is close to V_{POS} (that is, too high for normal boost operation). When operating in diode mode the converter's high-side switch stops switching and its body diode is used as the rectifier. Boost converter efficiency is reduced when operating in diode mode. At low output currents ($\approx 2\text{ mA}$ and below), the boost converter automatically transitions from pulse-width modulation to pulse-skip mode. This ensures that V_{POS} stays in regulation but increases the output voltage ripple on V_{POS} .

8.4.3 Operation with CTRL

When a low-level signal is applied to the CTRL pin the device is disabled and switching is inhibited. When the input supply voltage is above the UVLO threshold and a high-level signal is applied to the CTRL pin the device is enabled and its start-up sequence begins.

8.5 Programming

8.5.1 Programming V_{NEG}

The output voltage of the inverting buck-boost converter (V_{NEG}) can be programmed using the CTRL pin. If output voltage programming is not required, the CTRL pin can be used as a standard enable pin (see [Enable \(CTRL\)](#)).

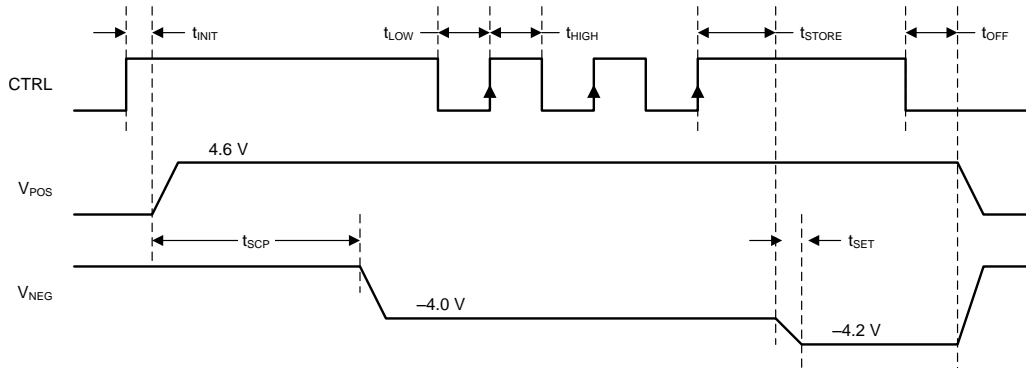

Figure 7. Programming V_{NEG} Using the CTRL Pin

When the CTRL pin is pulled high, the inverting buck-boost converter starts up with its default voltage of $-4V$. The device now counts the rising edges applied to the CTRL pin and sets the output voltage (V_{NEG}) according to [Table 1](#). For the timing diagram shown in [Figure 7](#), V_{NEG} is programmed to $-4.2V$, since three rising edges are detected.

The CTRL interface is designed to work with pulses whose duration is between $2\mu s$ and $25\mu s$. Pulses shorter than $2\mu s$ or longer than $25\mu s$ are not ensured to be recognized.

Table 1. Programming Table for V_{NEG}

9 Applications and Implementation

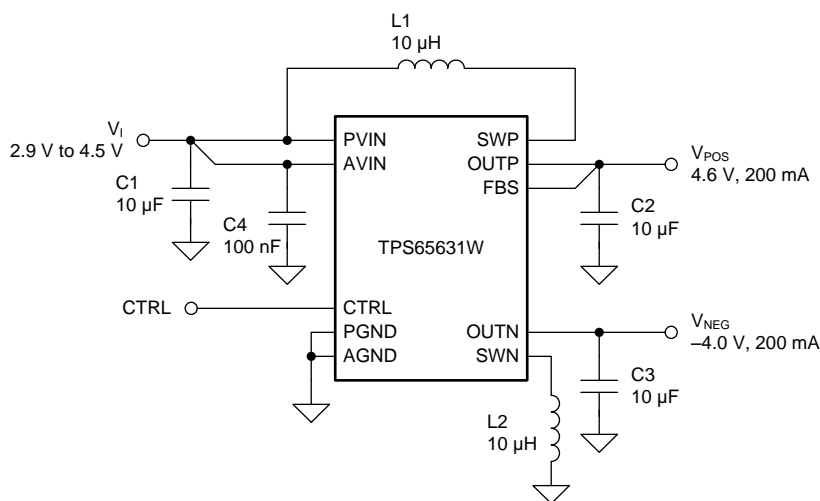

NOTE

Information in the following applications and implementation sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

Figure 8 shows a typical application circuit suitable for supplying AMOLED displays in smartphone applications. The circuit is designed to operate from a single-cell Li-Ion battery and generates a positive output voltage V_{POS} of 4.6 V and a negative output voltage of -4 V. Both outputs are capable of supplying up to 200 mA of output current.

Figure 8. Typical Application Schematic

9.2.1 Design Requirements

For this design example, use the following input parameters.

Table 2. Design Parameters

DESIGN PARAMETER	EXAMPLE
Input voltage range	2.9 V to 4.5 V
Output voltage	$V_{POS} = 4.6V$, $V_{NEG} = -4 V$

9.2.2 Detailed Design Procedure

In order to maximize performance, the TPS65631W has been optimized for use with a relatively narrow range of component values, and customers are strongly recommended to use the application circuit shown in Figure 8 with the components listed in Table 3 and Table 4.

9.2.2.1 Inductor Selection

The boost converter and inverting buck-boost converter have been optimized for use with 10 µH inductors, and it is recommended that this value be used in all applications. Customers using other values of inductor are strongly recommended to characterize circuit performance on a case-by-case basis.

Table 3. Inductor Selection⁽¹⁾

		ABCO	LPP252012-100M
		Taiyo Yuden	MDKK2020T-100M

(1) See [Third-Party Products Disclaimer](#)

9.2.2.2 Capacitor Selection

The recommended capacitor values are shown in [Table 4](#). Applications using less than the recommended capacitance (e.g. to save PCB area) may experience increased voltage ripple. In general, the lower the output power, the lower the necessary capacitance.

Table 4. Capacitor Selection⁽¹⁾

PARAMETER	VALUE	MANUFACTURER	PART NUMBER

9.2.2.3 Stability

Applications using component values that differ significantly from those recommended in [Table 3](#) and [Table 4](#) should be checked for stability over the full range of operating conditions.

9.2.3 Application Curves

The performance shown in the following graphs was obtained using the circuit shown in [Figure 8](#) and the external components shown in [Table 3](#) and [Table 4](#). The output voltage settings for these measurements were $V_{POS} = 4.6\text{ V}$ and $V_{NEG} = -4\text{ V}$.

10 Power Supply Recommendations

The TPS65631W is designed to operate from an input voltage supply range between 2.9 V and 4.5 V. If the input supply is located more than a few centimeters from the TPS65631W additional bulk capacitance may be required. The 10 μ F shown in the schematics in this data sheet is a typical choice for this function.

11 Layout

11.1 Layout Guidelines

No PCB layout is perfect and compromises are always necessary. However, following the basic principles listed below (in order of importance) should go a long way to achieving good performance:

- Route switching currents on the top layer using short, wide traces. Do not route these signals through vias, which have relatively high parasitic inductance and resistance.
- Use a copper pour on layer 2 as a ground plane and thermal spreader, and connect the thermal pad to it using a number of thermal vias.
- Place C1 as close as possible to pin 10.
- Place C2 as close as possible to pins 2 and 3.
- Place C3 as close as possible to pin 7.
- Place L1 as close as possible to pin 1.
- Place L2 as close as possible to pin 10.
- Use the thermal pad to join AGND and PGND.
- Connect the FBS pin directly to the positive pin of C2, that is, keep this connection separate from the connection between OUTP and C2.

Figure 23 illustrates how a PCB layout following the above principles may be realized in practice.

11.2 Layout Example

Figure 23 shows the above principles implemented for the circuit of Figure 8.

- Via to signal layer on internal or bottom layer.
- Thermal via to copper pour on internal or bottom layer.
