

## TPS65912x PMU for Processor Power

### 1 Device Overview

#### 1.1 Features

- Four Step-Down Converters:
  - $V_{IN}$  Range From 2.7 V to 5.5 V
  - Power Save Mode at Light Load Current
  - Output Voltage Accuracy in PWM Mode  $\pm 2\%$
  - Typical 26- $\mu$ A Quiescent Current per Converter
  - Dynamic Voltage Scaling
  - 100% Duty Cycle for Lowest Dropout
- Ten LDOs:
  - 8 General-Purpose LDOs
  - Output Voltage Range From 0.8 V to 3.3 V
  - 2 Low-Noise RF-LDOs
  - Output Voltage Range From 1.6 V to 3.3 V
  - 32- $\mu$ A Quiescent Current
  - Preregulation Support by Separate Power Inputs
  - ECO Mode
  - $V_{IN}$  Range of LDOs Respective to the Following Voltage Ranges:
    - 1.8 V to 3.6 V
    - 3.0 V to 5.5 V
- Three LED Outputs:
  - Internal Dimming Using I<sup>2</sup>C
  - Multiplexed With GPIOs
  - Up to 20 mA per Current Sink
- Thermal Monitoring
  - High Temperature Warning
  - Thermal Shutdown
- Bypass Switch
  - Used With DCDC4 in Applications Powering an RF-PA
  - For Example, as Supply Switch for SD Cards
- Interface
  - I<sup>2</sup>C Interface
  - Power I<sup>2</sup>C Interface for Dynamic Voltage Scaling
  - SPI
- 32-kHz RC Oscillator
- Undervoltage Lockout and Battery Fault Comparator
- Long Button-Press Detection
- Flexible Power-Up and Power-Down Sequencing
- 3.6-mm x 3.6-mm DSBGA Package With 0.4-mm Pitch

#### 1.2 Applications

- Data Cards
- Smart Phones
- Wireless Routers and Switches
- Tablets
- Industrial Applications
- LTE Modem
- GPS

#### 1.3 Description

The TPS65912x device provides four configurable step-down converters with up to 2.5-A output current for memory, processor core, I/O, or preregulation of LDOs. The device also contains ten LDO regulators for external use. These LDOs can be supplied from either a battery or a preregulated supply. Power-up or power-down controller is configurable and can support any power-up or power-down sequences (OTP-based). The TPS65912x device integrates a 32-kHz RC oscillator to sequence all resources during power up or power down. All LDOs and DC-DC converters can be controlled by I<sup>2</sup>C-SPI interface or basic ENABLE balls. In addition, an independent automatic voltage-scaling interface allows for transitioning DC-DC to a different voltage by I<sup>2</sup>C or basic Roof/Floor Control. Three RGB LEDs with an advanced dimming feature are integrated inside the device. GPIO functionality is multiplexed with LED/ENABLE/SPI when not used. Each GPIO can be configured as part of the power-up sequence to control external resources. One SLEEP pin enables power mode control between active mode and preprogrammed sleep mode for power optimization. For system control, the TPS65912x device has one comparator for system state management. The TPS65912x device comes in a 9-pin x 9-pin DSBGA package (3.6 mm x 3.6 mm) with a 0.4-mm pitch.

Device Information<sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE
TPS65912x	DSBGA (81)	3.6 mm x 3.6 mm

(1) For more information, see the [Mechanical, Packaging, and Orderable Information](#) section.

1.4 Functional Block Diagram

Figure 1-1 shows the functional block diagram of the TPS65912x device.

## 2 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

---

<b>Changes from Revision B (April 2015) to Revision C</b>	<b>Page</b>
• Deleted the <i>Ordering Information</i> table .....	<a href="#">5</a>
• Changed the TPS659122 default output voltage setting for CONFIG1=LOW for DCDC1_OP / DCDC1_AVS, DCDC3_OP / DCDC3_AVS, and DCDC4_OP / DCDC4_AVS in the <i>Default Settings for TPS659122</i> table .....	<a href="#">5</a>
• Changed some bit values for TPS659122 for CONFIG1=LOW and TPS659122 for CONFIG1=HIGH in the ECEC and LDO register sections .....	<a href="#">63</a>
• Added the <i>Application Information</i> , <i>Design Parameters</i> , external component list, and <i>Layout Example</i> .....	<a href="#">124</a>
• Added the <i>Receiving Notification of Documentation Updates</i> section .....	<a href="#">137</a>

---

<b>Changes from Revision A (March 2015) to Revision B</b>	<b>Page</b>
• Changed Applications section.....	<a href="#">1</a>

---

<b>Changes from Original (August 2012) to Revision A</b>	<b>Page</b>
• Changed format of the data sheet to TI standard .....	<a href="#">1</a>
• Added TPS659122 part number .....	<a href="#">1</a>

---

### 3 Default Settings

**Table 3-1** lists the default output voltages for the DC-DC converters and the LDOs. For DCDC1 to DCDC4 and LDO1 to LDO4, there are two registers defining the output voltage. DCDCx\_OP and LDOx\_OP is used in active mode when CONFIG2=1. With CONFIG2=0, the status of the DCDCx\_SEL pin is used to select between register \_OP vs \_AVS. With DCDCx\_SEL=0, the \_OP register defines the output voltage while \_AVS sets the output voltage when DCDCx\_SEL=1. LDO1 to LDO4 can be mapped to one of the DCDCx\_SEL pins. See [Section 7.13](#) for register DEF\_VOLT\_MAPPING for details.

**Table 3-1. Default Settings for TPS659121**

Converter / LDO register	TPS659121 default output voltage setting for CONFIG1=LOW	TPS659121 default output voltage setting for CONFIG1=HIGH
DCDC1_OP / DCDC1_AVS	0.85 V / 0.90 V	0.85 V / 0.90 V
DCDC2_OP / DCDC2_AVS	1.8 V / 2.0 V	1.8 V / 2.0 V
DCDC3_OP / DCDC3_AVS	3.2 V / 2.7 V	3.2 V / 2.7 V
DCDC4_OP / DCDC4_AVS	0.5 V / 0.5 V	0.5 V / 0.5 V
LDO1_OP / LDO1_AVS	0.85 V / 0.90 V	0.85 V / 0.90 V
LDO2_OP / LDO2_AVS	0.85 V / 0.90 V	0.85 V / 0.90 V
LDO3_OP / LDO3_AVS	2.85 V / 1.20 V	2.85 V / 1.20 V
LDO4_OP / LDO4_AVS	1.8 V / 1.7 V	1.8 V / 1.7 V
LDO5	2.7 V	2.7 V
LDO6	1.8 V	1.8 V
LDO7	3.0 V	3.0 V
LDO8	3.1 V	3.1 V
LDO9	3.0 V	3.0 V
LDO10	1.8 V	1.8 V

**Table 3-2. Default Settings for TPS659122**

Converter / LDO register	TPS659122 default output voltage setting for CONFIG1=LOW	TPS659122 default output voltage setting for CONFIG1=HIGH
DCDC1_OP / DCDC1_AVS	1.1375 V / 1.375 V	1.2 V / 1.1 V
DCDC2_OP / DCDC2_AVS	1.8 V / 1.8 V	1.8 V / 1.8 V
DCDC3_OP / DCDC3_AVS	1.1375 V / 1.375 V	2.1 V / 2.0 V
DCDC4_OP / DCDC4_AVS	1.1375 V / 1.375 V	3.3 V / 3.3 V
LDO1_OP / LDO1_AVS	1.7 V / 1.7 V	1.8 V / 3.0 V
LDO2_OP / LDO2_AVS	0.8 V / 0.8 V	3.0 V / 1.8 V
LDO3_OP / LDO3_AVS	0.8 V / 0.8 V	3.0 V / 3.0 V
LDO4_OP / LDO4_AVS	1.8 V / 1.8 V	1.85 V / 1.85 V
LDO5	1.8 V	1.85 V
LDO6	0.8 V	1.85 V
LDO7	1.8 V	1.85 V
LDO8	1.8 V	2.85 V
LDO9	3.3 V	1.85 V
LDO10	1.2 V	3.0 V

## 4 Pin Configuration and Functions

Figure 4-1 shows the 81-Pin YFF Die-Size Ball-Grid Array pin assignments.

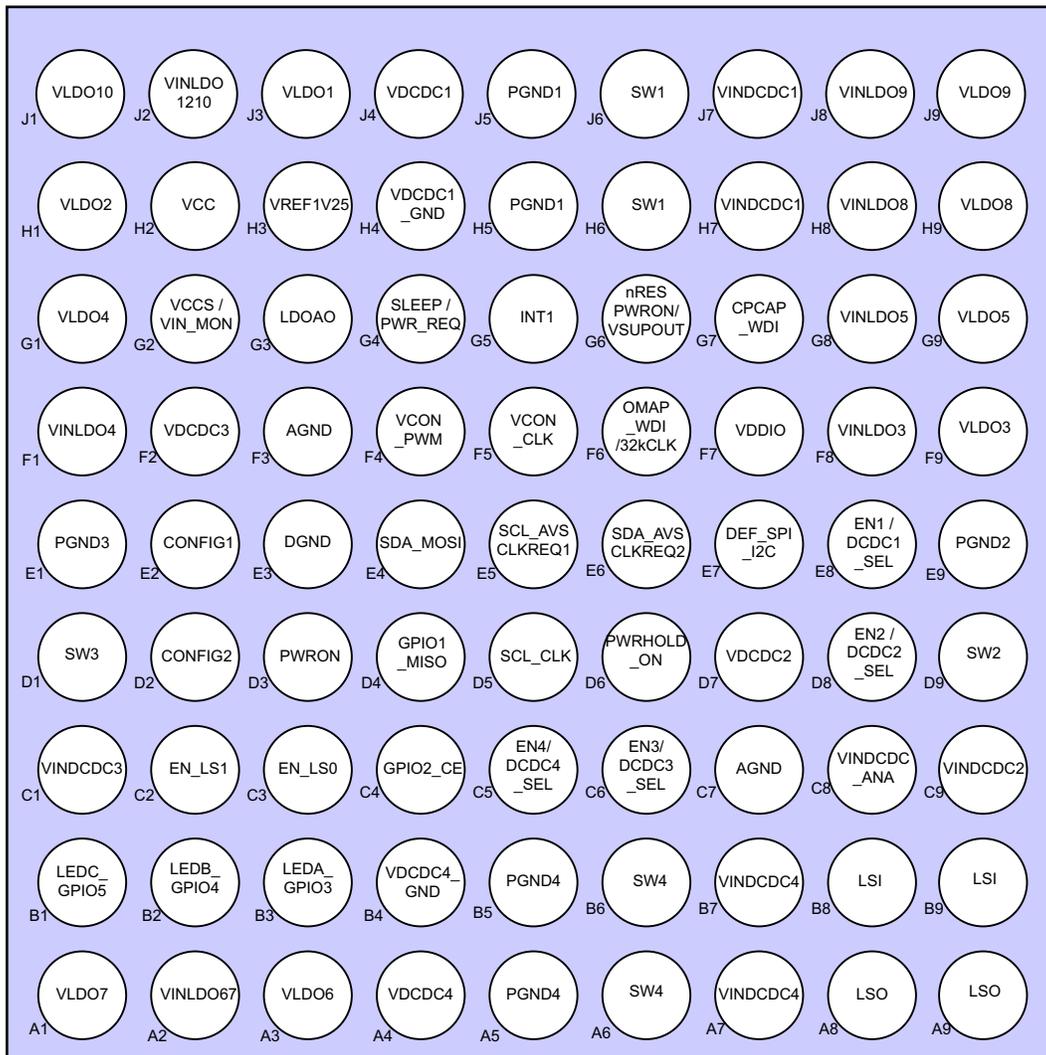

Figure 4-1. 81-Pin YFF DSBGA (Bottom View)

## 4.1 Pin Functions

### Pin Functions

TERMINAL			TYPE	DESCRIPTION
NAME	ALT NAME	NO.		
<b>REFERENCE</b>				
VREF1V25		H3	O	Internal reference voltage. Connect a 100-nF capacitor from this pin to GND. Do not load this pin externally.
AGND		F3, C7	–	Analog ground connection; connect to PGND on the PCB
<b>DRIVERS / LIGHTING</b>				
LEDA/GPIO3		B3	I/O	General-purpose I/O or LED driver output
LEDB/GPIO4		B2	I/O	General-purpose I/O or LED driver output
LEDC/GPIO5		B1	I/O	General-purpose I/O or LED driver output
<b>STEP-DOWN CONVERTERS</b>				
VINDCDC_ANA		C8	I	Analog supply input for DC-DC converters; must be connected to VINDCDC1, VINDCDC2, VINDCDC3 and VINDCDC4
VINDCDC1		H7, J7	I	Power input to DCDC1 converter; connect to VINDCDC2, VINDCDC3, VINDCDC4 and VINDCDC_ANA
VDCDC1		J4	I	Voltage sense (feedback) input "+" for DCDC1
VDCDC1_GND		H4	I	Voltage sense (feedback) input GND for DCDC1; tie to the GND plane or to AGND, alternatively tie to the GND-pad of the output capacitor
SW1		H6, J6	O	Switch node of DCDC1; connect output inductor
PGND1		H5, J5	–	Power GND connection for DCDC1 converter
VCON_PWM		F4	I	PWM period signal for dynamic voltage scaling on DCDC1
VCON_CLK		F5	I	Clock signal for dynamic voltage scaling on DCDC1
VINDCDC2		C9	I	Power input to DCDC2 converter; connect to VINDCDC1, VINDCDC3, VINDCDC4 and VINDCDC_ANA
VDCDC2		D7	I	Voltage sense (feedback) input for DCDC2
SW2		D9	O	Switch node of DCDC2; connect output inductor
PGND2		E9	–	Power GND connection for DCDC2 converter
VINDCDC3		C1	I	Power input to DCDC3 converter; connect to VINDCDC1, VINDCDC2, VINDCDC4 and VINDCDC_ANA
VDCDC3		F2	I	Voltage sense (feedback) input for DCDC3
SW3		D1	O	Switch node of DCDC3; connect output inductor
PGND3		E1	–	Power GND connection for DCDC3 converter
VINDCDC4		A7, B7	I	Power input to DCDC4 converter; connect to VINDCDC1, VINDCDC2, VINDCDC3 and VINDCDC_ANA
VDCDC4		A4	I	Voltage sense (feedback) input "+" for DCDC4
VDCDC4_GND		B4	I	Voltage sense (feedback) input GND for DCDC4; tie to the GND plane or to AGND, alternatively tie to the GND-pad of the output capacitor
SW4		A6, B6	O	Switch node of DCDC4; connect output inductor
PGND4		A5, B5	–	Power GND connection for DCDC4 converter
<b>LOAD SWITCH</b>				
LSI		B8, B9	I	Input of the load switch
LSO		A8, A9	O	Output of the load switch
EN_LS0		C3	I	Load switch enable pin; the status is copied to Bit [LOADSWITCH:ENABLE0] in state CONFIG
EN_LS1		C2	I	Load switch enable pin; the status is copied to Bit [LOADSWITCH:ENABLE1] in state CONFIG

## Pin Functions (continued)

TERMINAL			TYPE	DESCRIPTION
NAME	ALT NAME	NO.		
<b>LOW DROPOUT REGULATORS</b>				
VINLDO1210		J2	I	Power input for LDO1, LDO2 and LDO10
VINLDO3		F8	I	Power input for LDO3
VINLDO4		F1	I	Power input for LDO4
VINLDO5		G8	I	Power input for LDO5
VINLDO67		A2	I	Power input for LDO6 and LDO7
VINLDO8		H8	I	Power input for LDO8
VINLDO9		J8	I	Power input for LDO9
LDOAO		G3	O	"LDO always on" internal supply; connect buffer capacitor
VLDO1		J3	O	LDO1 output
VLDO2		H1	O	LDO2 output
VLDO3		F9	O	LDO3 output
VLDO4		G1	O	LDO4 output
VLDO5		G9	O	LDO5 output
VLDO6		A3	O	LDO6 output
VLDO7		A1	O	LDO7 output
VLDO8		H9	O	LDO8 output
VLDO9		J9	O	LDO9 output
VLDO10		J1	O	LDO10 output
<b>STANDARD INTERFACE</b>				
DEF_SPI_I2C-GPIO		E7	I	Digital input that defines whether SPI or I <sup>2</sup> C and GPIOs is available on pins C4, D4, E4, D5: 0=SPI; 1=I <sup>2</sup> C and GPIO1 and GPIO2
SCL_SCK	SCK	D5	I	I <sup>2</sup> C SCL for DEF_SPI_I2C=1 or SPI SCK for DEF_SPI_I2C=0
SDA_MOSI	MOSI	E4	I/O	I <sup>2</sup> C SDA for DEF_SPI_I2C=1 or SPI MASTER OUT SLAVE IN (MOSI) for DEF_SPI_I2C=0
GPIO1_MISO	MISO	D4	I/O	GPIO1 for DEF_SPI_I2C=1 or SPI MASTER IN SLAVE OUT (MISO) for DEF_SPI_I2C=0
GPIO2_CE	CE	C4	I/O	GPIO2 for DEF_SPI_I2C=1 or SPI CHIP ENABLE (CE) active HIGH for DEF_SPI_I2C=0
<b>ENABLE / VOLTAGE SCALING</b>				
EN1 / DCDC1_SEL <sup>(1)</sup>	DCDC1_SEL	E8	I	Enable pin or voltage scaling pin changing the output of a converter or a group of converters between 2 predefined values
EN2 / DCDC2_SEL <sup>(1)</sup>	DCDC2_SEL	D8	I	Enable pin or voltage scaling pin changing the output of a converter or a group of converters between 2 predefined values
EN3 / DCDC3_SEL <sup>(1)</sup>	DCDC3_SEL	C6	I	Enable pin or voltage scaling pin changing the output of a converter or a group of converters between 2 predefined values
EN4 / DCDC4_SEL <sup>(1)</sup>	DCDC4_SEL	C5	I	Enable pin or voltage scaling pin changing the output of a converter or a group of converters between 2 predefined values
SCL_AVS / CLK_REQ1 <sup>(2)</sup>	CLK_REQ1	E5	I	Power I <sup>2</sup> C for dynamic voltage scaling: clock pin or clock request signal1 used to enable and disable power resources
SDA_AVS / CLK_REQ2 <sup>(2)</sup>	CLK_REQ2	E6	I/O	Power I <sup>2</sup> C for dynamic voltage scaling; data pin or clock request signal2 used to enable and disable power resources
SLEEP / PWR_REQ <sup>(2)</sup>	PWR_REQ	G4	I	SLEEP mode input or CLK request input
nRESPWRON / VSUP_OUT	VSUP_OUT	G6	O	Reset output or output of voltage monitor
VCCS / VIN_MON	VIN_MON	G2	I	Voltage sense for input voltage monitor; output on pin VSUP_OUT
PWRHOLD_ON	ON	D6	I	POWERHOLD or ON; enable input
INT1		G5	O	Interrupt output

(1) DCDCx\_SEL is selected by pulling pin CONFIG2 to GND; this also selects CLK\_REQx and PWR\_REQ as enable resources.

(2) CLK\_REQ1, CLK\_REQ2 and PWR\_REQ is selected by pulling pin CONFIG2 to GND.

**Pin Functions (continued)**

TERMINAL			TYPE	DESCRIPTION
NAME	ALT NAME	NO.		
nPWRON	/RESIN (optional)	D3	I	Active low, debounced power-on input or power-request input to start power-up sequencing; alternatively active-low reset input to TPS65912x; debounced by 10 ms (OTP option); tie to LDOAO for a logic high if not used.
OMAP_WDI_32k_OUT		F6	I	Input from OMAP WDI pin to AND gate; alternatively 32-kHz RC oscillator output
CPCAP_WDI		G7	O	Push-pull output at VDDIO level of AND gate; connect to CPCAP WDI input
CONFIG1		E2	I	Selects predefined startup options and default voltages; chooses from two internal OTP settings; tie to GND or LDOAO
CONFIG2		D2	I	Selects predefined startup options; configures pins as DCDC1_SEL, DCDC2_SEL, DCDC3_SEL and DCDC4_SEL as well as CLK_REQ and PWR_REQ signals with CONFIG2 tied to GND. Tie to LDOAO for a logic high level.
VCC		H2	I	Digital supply input
VDDIO		F7	I	Supply voltage input for GPIOs and output stages that sets the HIGH level voltage (I/O voltage)
DGND		E3	–	Digital GND connection, tie to AGND and PGNDx on the PCB

## 5 Specifications

### 5.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
Voltage	All pins except A/PGND pins and pins listed below with respect to AGND	-0.3	6	V
	VLDO1, VLDO2, VLDO3, VLDO4, VLDO5, VLDO6, VLDO7, VLDO8, VLDO9, VLDO10, VINLDO1210, VINLDO3, EN1 (DCDC1_SEL), EN2 (DCDC2_SEL), EN3 (DCDC3_SEL), EN4 (DCDC4_SEL) SLEEP (PWR_REQ), CLK_REQ1, CLK_REQ2 VDDIO, CONFIG1, CONFIG2, DEF_SPI_I2C-GPIO, EN_LS0, EN_LS1, OMAP_WDI, CPCAP_WDI, VCON_CLK with respect to AGND	-0.3	3.6	
	Pin VDCDC1, VDCDC2, VDCDC3, VDCDC4 with respect to AGND	-0.3	3.8	
	Pins SDA_SDI, SCL_SCK, SDO_GPIO1, SCE_GPIO2, SDA_AVS, SCL_AVS, INT1, 32KCLKOUT, GPIO3 and GPIO4 and GPIO5 if defined as GPIOs with push-pull output (otherwise it is 6-V rated), NRESPWRON if nRESPWRON is push-pull output (otherwise it is 6-V rated) with respect to AGND	-0.3	VDDIO + 0.3	
	V <sub>CC</sub>	VDDIO	6	
Current	All non power pins		5	mA
	Power pins (per pin)		2	A
Operating free-air temperature, T <sub>A</sub>		-40	85	°C
Maximum junction temperature, T <sub>J</sub>			125	°C
Storage temperature range, T <sub>stg</sub>		-65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under [Section 5.3](#) is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

### 5.2 ESD Ratings

		VALUE	UNIT	
V <sub>ESD</sub>	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS001 <sup>(1)</sup>	1000	V
		Charged device model (CDM), per JEDEC22-C101 <sup>(2)</sup>	250	V

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 5.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
<b>DC-DC CONVERTERS</b>					
VIN1, VIN2, VIN3, VIN4	Input voltage for step-down converter DCDC1, DCDC2, DCDC3, DCDC4	2.7		5.5	V
	Output voltage for step-down converter DCDC1, DCDC2, DCDC3 <sup>(1)</sup>	0.5		3.8	V
	Output voltage for step-down converter DCDC4 <sup>(1)</sup>	0.5		3.8	V
	Inductance at L2, L3	0.5	1.0	1.3	μH
	Inductance at L1, L4	0.5	1.0	1.3	μH
CIN1, CIN4	Input capacitance at VIN1 and VIN4 (on each pin)	10	22		μF
CIN2, CIN3	Input capacitance at VIN2 and VIN3 (on each pin)	4.7	10		μF
COU <sub>DCDC1,2,3</sub>	Output capacitance at DCDC1, DCDC2 and DCDC3	4.7	10	22	μF
COU <sub>DCDC4</sub>	Output capacitance at DCDC4	10	22	47	μF
<b>LDOs</b>					
VINLDO1210	Input voltage range for LDO1, LDO2 and LDO10	1.7		3.6	V
VINLDO4	Input voltage range for LDO4	1.9		5.5	V
VINLDO5	Input voltage range for LDO5	1.9		5.5	V
V <sub>LDO1</sub> , V <sub>LDO2</sub> , V <sub>LDO3</sub> , V <sub>LDO6</sub> , V <sub>LDO7</sub> , V <sub>LDO8</sub> , V <sub>LDO9</sub> , V <sub>LDO10</sub>	Output voltage for general purpose (GP) LDOs <sup>(1)</sup>	0.8		3.3	V
V <sub>LDO4</sub> , V <sub>LDO5</sub>	Output voltage for RF-LDOs	1.6		3.3	V
CINLDO1210 CINLDO3, CINLDO4, CINLDO5, CINLDO67 CINLDO8 CINLDO8	Input capacitance on LDO supply pins	0.5			μF
C <sub>outLDO4</sub> , C <sub>outLDO5</sub>	Output capacitance on LDO4 and LDO5	2.2		10	μF
C <sub>outLDO1</sub> , C <sub>outLDO2</sub> C <sub>outLDO3</sub> C <sub>outLDO6</sub> C <sub>outLDO7</sub> C <sub>outLDO8</sub>	Output capacitance LDO1, LDO2, LDO3, LDO6, LDO7, LDO8 These LDOs are <i>capless</i> , the required capacitance can be placed at the load	0.5		10	μF
C <sub>outLDO9</sub> C <sub>outLDO10</sub>	Output capacitance LDO9 and LDO10 These LDOs are <i>capless</i> , the required capacitance can be placed at the load	1		10	μF
C <sub>outLDOAO</sub>	Output capacitance on LDOAO	0.5		10	μF
C <sub>VIN_DCDC_ANA</sub>	Input capacitance on VIN_DCDC_ANA	100			nF
C <sub>VCC</sub>	Input capacitance on VCC	100			nF
C <sub>VDDIO</sub>	Input capacitance on VDDIO	100			nF
T <sub>A</sub>	Operating ambient temperature	-40		85	°C
T <sub>J</sub>	Operating junction temperature	-40		125	°C

- (1) The maximum output voltage of DCDC1 to DCDC4 and LDO1 to LDO4 can be reduced by a OTP setting to adopt the maximum voltage to the requirements (or maximum ratings) of the load powered. This allows to protect the processor from exceeding the maximum ratings for the core voltage. The value is set at T1 upon customer request in nonvolatile memory (OTP).

## 5.4 Thermal Characteristics

THERMAL METRIC <sup>(1)</sup>		TPS65912	UNIT
		YFF (DSBGA)	
		81 PINS	
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	41.3	°C/W
R <sub>θJctop</sub>	Junction-to-case (top) thermal resistance	0.1	°C/W

## 7 Detailed Description

### 7.1 Overview

The TPS65912x device is an integrated power-management integrated circuit (PMIC), available in an 81-pin, 0.4-mm pitch, 3.6-mm × 3.6-mm DSBGA package. It is designed for applications including data cards, smart phones, wireless routers and switchers, LTE modems, industrial applications, GPS, and tablets. It provides four configurable step-down converter rails, with a power save mode for light loads. The TPS65912x device also provides ten external LDO rails - eight general purpose LDOs and two low-noise RF-LDOs. It also comes with two I2C interface channels or one SPI interface channel, 5 GPIOs, 32-kHz RC oscillator, and programmable power sequencer and control for supporting different processors and applications. The four step-down converter rails are consisting of four high frequency switch mode converters with integrated FETs. They are capable of synchronizing to an external clock input and supports switching frequency between 2.8 MHz and 3.5 MHz. The DCDC4 rail also includes a bypass switch that can be used to turn on and off high current loads. In addition, the DCDC rails support dynamic voltage scaling with a dedicated I2C interface. The eight general LDOs support 0.8 V to 3.3 V output, while the two low-noise LDOs support 1.6 V to 3.3 V. All LDOs and step-down converters can be controlled by the SPI or I2C interface. The power-up and power-down controller is configurable and programmable through OTP. The TPS65912x device includes a 32-kHz RC oscillator to sequence all resources during power up and power down. Configurable GPIOs with multiplexed feature are available on the TPS65912x device. The GPIOs can be configured and used as enable signals for external resources, which can be included into the power-up and power-down sequence. The general-purpose (GP) sigma-delta analog-to-digital converter (ADC) with two external input channels included in this device can be used as thermal or voltage and current monitors. Lastly, there is a long button-press detection that allows startup of the device with the hold of a button.

## 7.2 Functional Block Diagram

## 7.3 Linear Regulators

The power management core has 10 LDOs with various output voltage/current capabilities. Each LDO output voltage can be set independently through the communication bus (see *LDO Voltage Settings* table in [Section 7.28.2](#)) and the transition occurs immediately if the LDO is enabled.

### 7.3.1 Low Quiescent Current Mode (Eco-mode™)

Each LDO is equipped with a low quiescent current mode that can be enabled or disabled separately. When the ECO bit is 1, the LDOx Eco-mode™ control scheme is enabled.

### 7.3.2 Output Discharge

Each LDO is equipped with an output discharge bit. When the bit is set to 1, the output of the LDO will be discharged to ground with the equivalent of a 300-Ω resistor. If the LDO is enabled, the discharge bit is ignored.

### 7.3.3 Thermal Shutdown

There is a global thermal shutdown protection for all step-down converters and LDOs. The thermal sensor will generate an early warning depending on the setting of register THRM\_REG. If the temperature rises above the thermal shutdown threshold, the complete device is powered down to OFF state.

### 7.3.4 LDO Enable

The LDOs enable/disable is part of the flexible power-up and power-down state machine. Each LDO can be programmed such that it is powered up automatically in one of the 15 time slots after a power-on condition occurs or is controlled by a dedicated pin. Pins EN\_1, EN\_2, EN\_3 and EN\_4 as well as pins CLK\_REQ1, CLK\_REQ2 and PWR\_REQ (SLEEP) can be mapped to any resource (LDOs, DC-DC converter, 32-kHz clock output or GPIO) to enable or disable it.

### 7.3.5 LDO Voltage Range

The output voltage range for the standard LDOs is 0.8 V to 3.3 V. For the RF-LDOs, LDO4 and LDO5, the output voltage range is 1.6 V to 3.3 V. The most significant bit for the voltage settings SEL[5] on LDO4 and LDO5 is ignored and is internally set to 1.

### 7.3.6 LDO Power Good Comparator

The output voltage of each LDO is supervised by an internal power good comparator. Its output is setting and clearing the PGOOD bits in registers PGOOD and PGOOD2. The power good bits are not valid if the LDO is enabled but the input voltage to the LDO is below 1 V.

## 7.4 Step-Down Converters

The synchronous step-down converter used in the power management core includes a unique hysteric PWM controller scheme which enables switch frequencies over 3 MHz, excellent transient and AC load regulation as well as operation with tiny and cost competitive external components.

The controller topology supports forced PWM Mode as well as Power Save Mode operation. Power Save Mode operation reduces the quiescent current consumption and ensures high conversion efficiency at light loads by skipping switch pulses.

A significant advantage of this architecture compared to other hysteretic PWM controller topologies is its excellent DC and AC load regulation capability in combination with low output voltage ripple over the entire load range which makes this part well suited for audio and RF applications.

Once the output voltage falls below the threshold of the error comparator a switch pulse is initiated and the high side switch is turned on. It remains turned on until a minimum on time of  $T_{ONmin}$  expires and the output voltage trips the threshold of the error comparator or the inductor current reaches the high side switch current limit. Once the high side switch turns off, the low side switch rectifier is turned on and the inductor current ramps down until the high side switch turns on again or the inductor current reaches zero.

### 7.4.1 PWM/PFM Mode

In forced PWM Mode, the device avoids pulse skipping and allows easy filtering of the switch noise by external filter components. PWM mode is forced by setting bit `DCDCx_MODE = 1`. If this bit is not set, the DCDC outputs will switch to a low current PFM mode when there is light load and sufficient headroom between the DCDCx input and output rails.

### 7.4.2 Low Quiescent Current Mode

Each step-down converter may be individually controlled to enter a low quiescent current mode. This mode is entered when the ECO bit is **1**. In ECO mode, the quiescent current is reduced and the output voltage is supervised by a comparator while most part of the control is disabled to save power. ECO mode should only be enabled when a converter has less than 2 mA of load current. In addition, the ECO mode should be disabled prior to a load transient step to allow the converter to respond in a timely manner to the excess current draw. Setting the step-down converter into PWM mode by `DCDCx_MODE = 1` disables ECO mode independently from the setting of bit ECO.

### 7.4.3 Output Voltage Monitoring

Internal power good comparators monitors the switching regulator outputs and detect when the output voltage is below 90% of the programmed value. This information is used by the power management core to generate interrupts depending on specific I<sup>2</sup>C register settings. See the Interrupt Controller section for additional details. An individual power good comparator of the switching regulator will be blanked when the regulator is disabled or when the voltage of the regulator is transitioning from one set point to another.

### 7.4.4 Output Discharge

Each switching regulator is equipped with an output discharge enable bit. When the bit is set to 1, the output of the regulator will be discharged to ground with the equivalent of a 400-Ω resistor. If the enable bit of the regulator is set, the discharge bit is ignored.

### 7.4.5 Thermal Shutdown

There is a global thermal shutdown protection for all step-down converters and LDOs. The thermal sensor will generate an early warning depending on the setting of register `THRM_REG`. If the temperature rises above the thermal shutdown threshold, the complete device is powered down to OFF state.

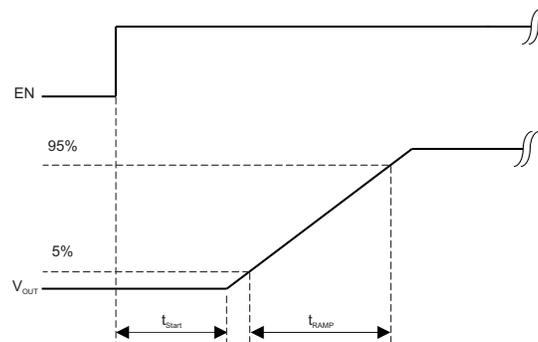

### 7.4.6 Step-Down Converter ENABLE

The step-down converter enable/disable is part of the flexible power-up and power-down state machine. Each converter can be programmed such that it is powered up automatically in one of the 15 time slots after a power-on condition occurs or is controlled by a dedicated pin. Pins EN\_1, EN\_2, EN\_3 and EN\_4 as well as pins CLK\_REQ1, CLK\_REQ2 and PWR\_REQ (SLEEP) can be mapped to any resource (LDOs, DC-DC converter, 32 kHz clock output or GPIO) to enable or disable it.

### 7.4.7 Step-Down converter SOFT START

The step-down converters in TPS65912x have an internal soft-start circuit that controls the ramp up of the output voltage. The output voltage ramps up from 5% to 95% of its nominal value within a time defined in [Section 5](#). This limits the inrush current in the converter during start up and prevents possible input voltage drops when a battery or high impedance power source is used. The soft-start circuit is enabled after the start-up time  $t_{start}$  has expired. For DCDC4, there is an option to set two different values for the start up and ramp time. For applications that require a fast response, set DCDC4\_CTRL:RAMP\_TIME = 1.

During soft start, the output voltage ramp up is controlled as shown in [Figure 7-1](#).

**Figure 7-1. Soft Start**

The step-down converter enable/disable is part of the flexible power-up and power-down state machine. Each converter can be programmed such that it is powered up automatically in one of the 15 time slots after a power-on condition occurs or is controlled by a dedicated pin. Pins EN\_1, EN\_2, EN\_3 and EN\_4 as well as pins CLK\_REQ1, CLK\_REQ2 and PWR\_REQ (SLEEP) can be mapped to any resource (LDOs, DC-DC converter, 32 kHz clock output or GPIO) to enable or disable it.

## 7.5 GPIOs

There are 5 GPIOs in TPS65912x. GPIO1 and GPIO2 are shared with the SPI interface, so they are not available if SPI is used. GPIO3, GPIO4 and GPIO5 are for general purpose use and are shared with the LED driver. GPIO1 and GPIO2 input and output stages are similar to GPIO3 however, they do not contain the LED current sink. If the output stage is programmed to push-pull, it pulls to the high-voltage set by VDDIO. With VDDIO being below the VDDIO undervoltage lockout, the high-side driver is disabled and the output is set to open drain.

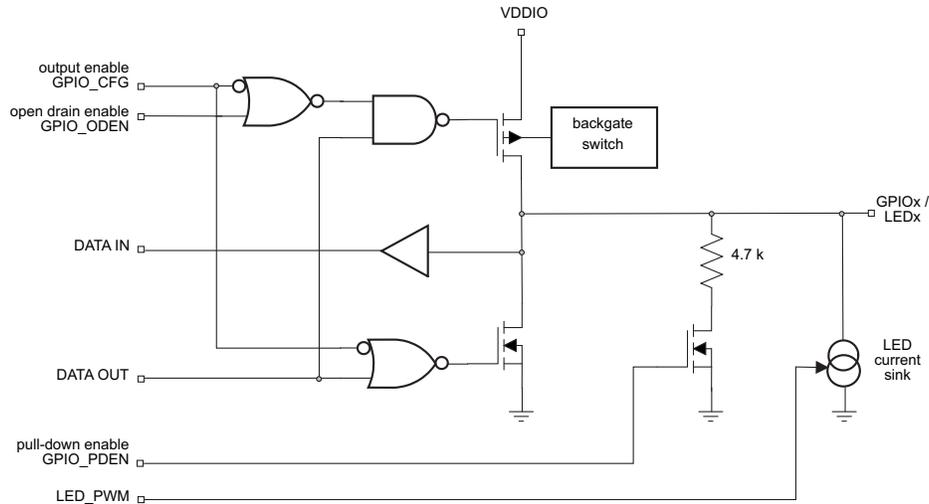

Figure 7-2. GPIO Block for GPIO3, GPIO4, and GPIO5

## 7.6 Power State Machine

The embedded power controller (EPC) manages the state of the device and controls the power up sequence.

The EPC will support the following states:

The transitions for the state machine are shown figure below

**NO SUPPLY** The main battery supply voltage is not high enough to power the LDOAO (LDO always ON) regulator. A global reset is asserted in this case. Everything on the device is off.

**CONFIG** This state is entered either from NO SUPPLY state automatically or from ACTIVE or SLEEP when TPS65912x is configured accordingly by Bit LOAD-OTP in [DEVCTRL:Bit6]. When CONFIG is entered, all registers are set to their default value; nRESPWRON is asserted.

**OFF** LDOAO is on and internal logic is active. All power supplies are in off-state. Device can detect and execute power-up sequence. nRESPWRON is asserted.

**ACTIVE** Device POWER ON enable conditions are met and regulated power supplies are ON or can be enabled with full current capability. Reset is released; interfaces are active.

**SLEEP** Device SLEEP enable conditions are met and selected regulated power supplies are in low-power/OFF mode.

## 7.7 Transition Conditions

- Device POWER ON enable conditions:
  - nPWRON signal low level
  - Or PWRHOLD signal high level
  - Or Pwr\_hold\_reg control bit set to 1 (default inactive)
  - Or interrupt flag active (default INT1 low) will generate a POWER ON enable condition during a fixed delay (During this delay it is expected processor to main acknowledge power by writing in Pwr\_Hold reg or setting Power Hold pin to 1). Interrupt sources Generate wake up only if they are not Mask (OTP/Register dependant)
- Device POWER ON disable conditions:
  - nPWRON signal low level during more than the Long Press delay: PWON\_LP\_DELAY (can be disable though register programming). The interrupt corresponding to this condition is the PWRON\_LP\_IT in INT\_STS\_REG register.
  - Or Die temperature has reached the thermal shutdown threshold (THERM\_TS=1)
  - Or DEV\_OFF\_RST control bit set to 1

- Device SLEEP enable condition:
  - SLEEP signal low level (Default, or high level depending of the programmed polarity)
  - AND DEV\_SLP control bit set to 1
  - AND interrupt flag inactive (default INT1 high): no none masked interrupt pending
- Device has three different reset scenarios:
  - Full reset: all digital of device is reset
    - Caused by POR (Power On Reset) when  $V_{CCS} < UVLO$
  - General reset:
    - Caused by turn-off event with  $LOAD-OTP=1$
    - Turn-off event by  $PWON\_LP\_OFF\_RST$  bit set to 1
    - Optionally for TPS65912x1 by pin PWRON pulled low for longer than 100 ms

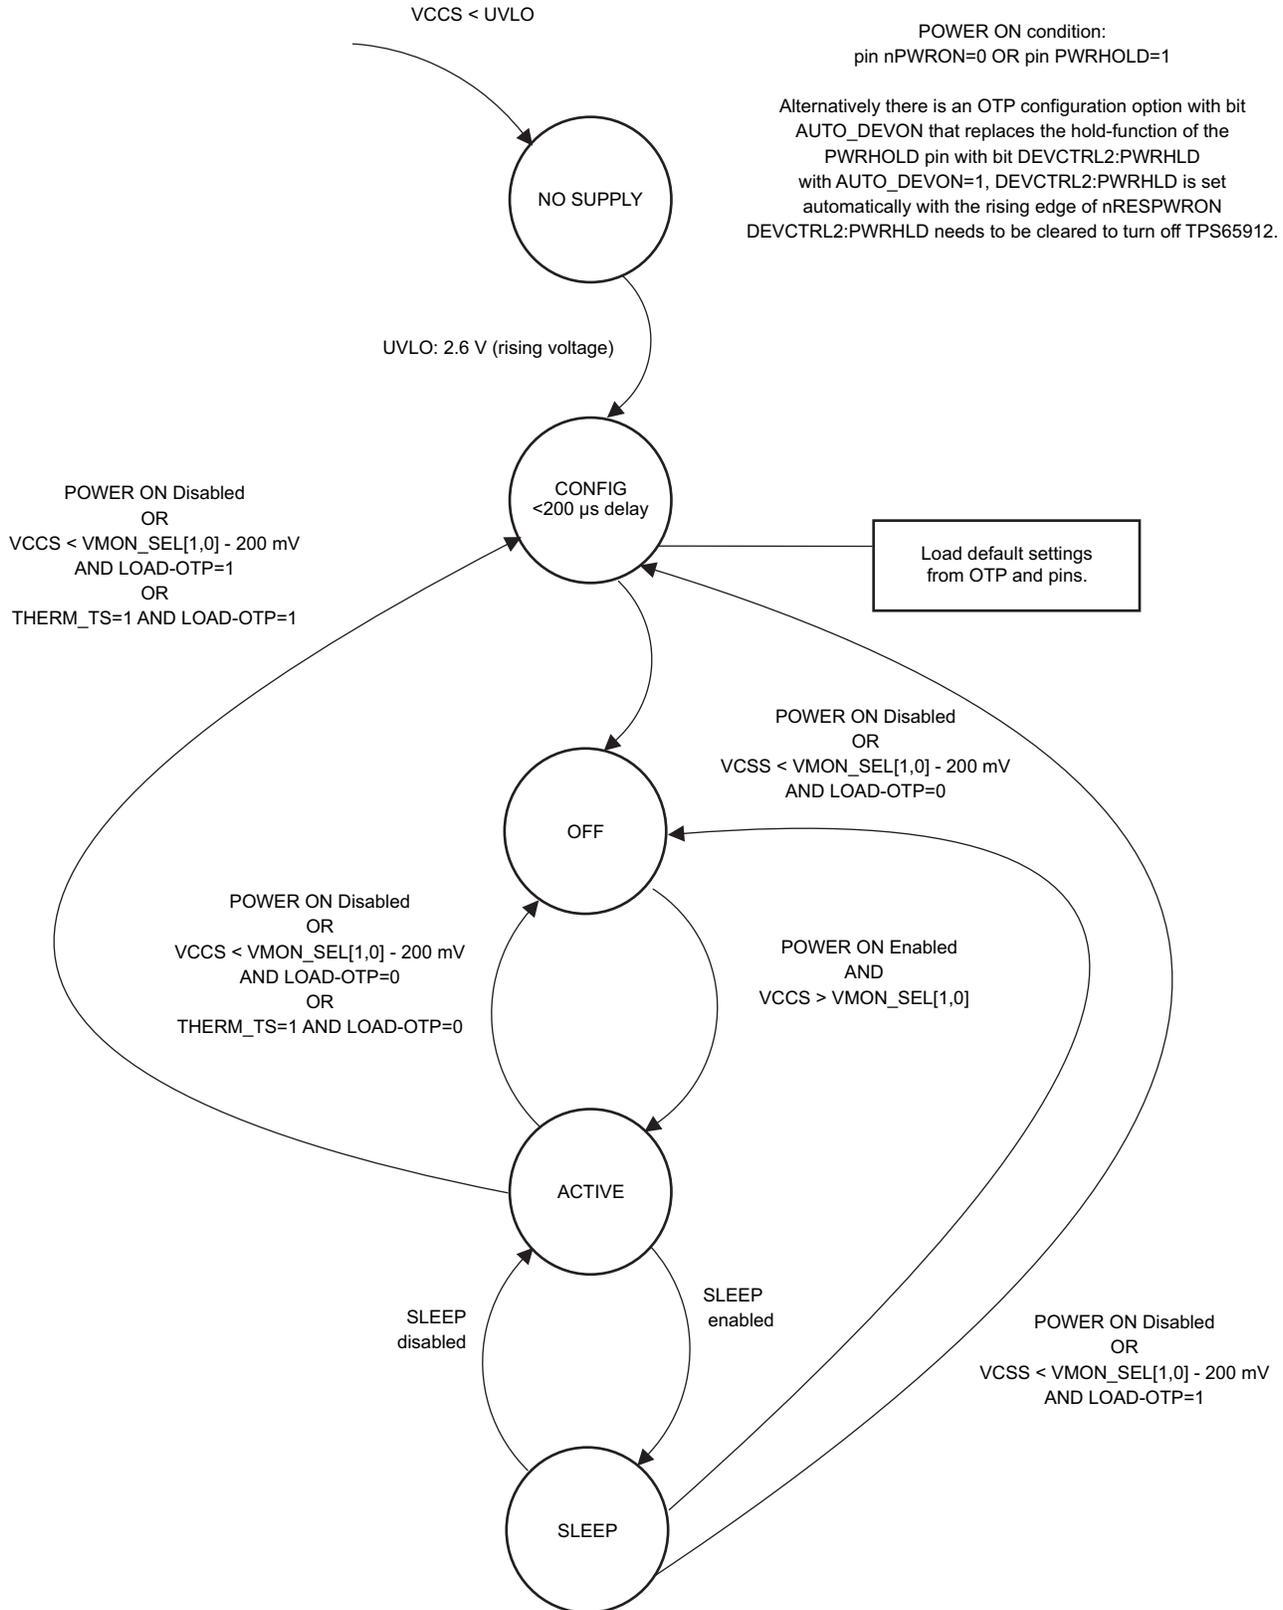

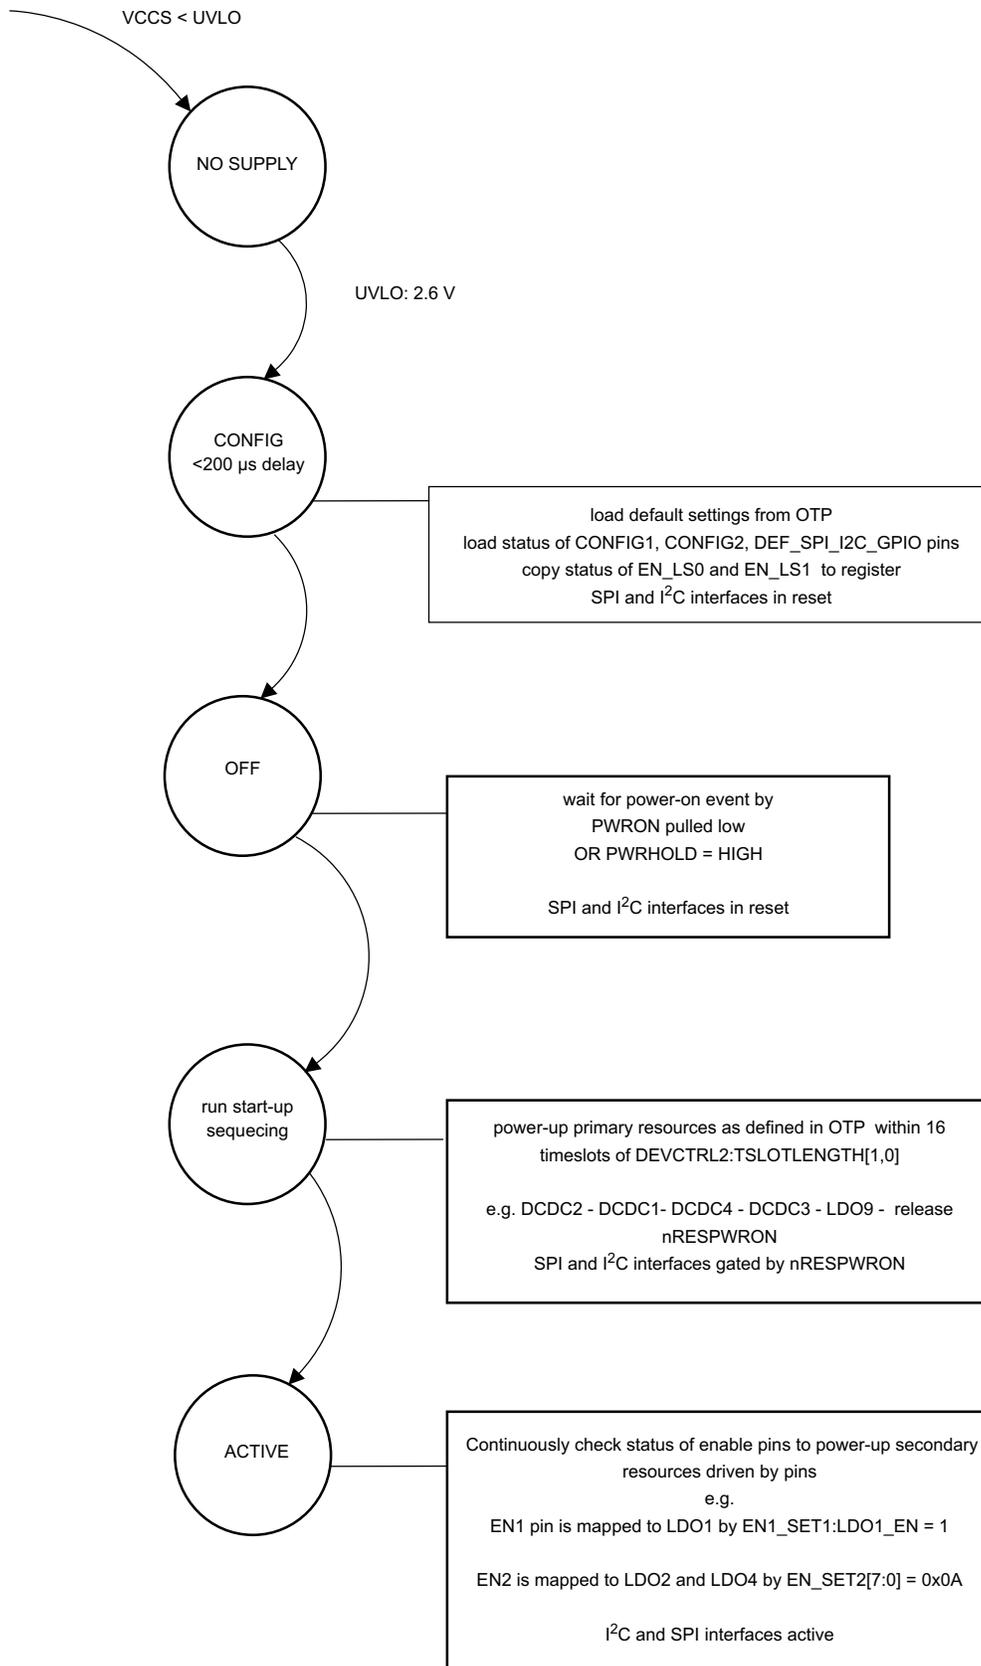

Figure 7-3. Embedded Power Control State Machine

**Figure 7-4. STARTUP Flow for CONFIG2=1**

Figure 7-4 is valid for CONFIG2=1. With CONFIG2=1, pins EN1, EN2, EN3 and EN4 are used as enable pins to enable one or several resources. Registers EN1\_SET1 and EN1\_SET2 define which converters or LDOs are controlled by pin EN1. Pins EN2, EN3, and EN4 are handled similarly.

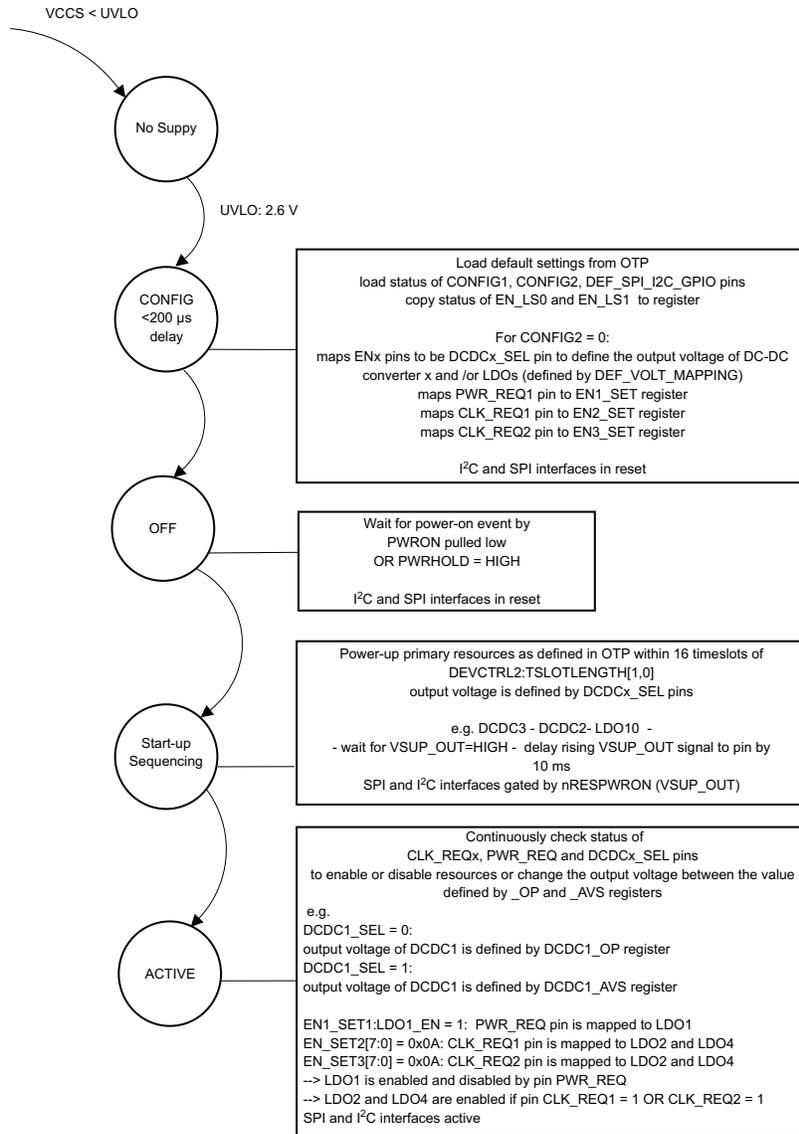

Figure 7-5. STARTUP Flow for CONFIG2=0

Figure 7-5 is valid for CONFIG2=0. With CONFIG2=0, pins EN1, EN2, EN3 and EN4 are re-mapped to be DCDCx\_SEL pins, defining which register is used to set the output voltage on a specific DC-DC converter. For example, DCDC1\_SEL=0 sets the output voltage of DCDC1 to what is defined by register DCDC1\_OP while DCDC1\_SEL=1 sets the voltage defined by DCDC1\_AVS. The DCDC2 voltage is defined by DCDC2\_SEL and so forth.

LDO1 to LDO4 can be mapped to DCDCx\_SEL pins. Register DEF\_VOLT\_MAPPING defines what LDO is controlled by what DCDCx\_SEL pin.

In addition to this, CONFIG2=0 also re-maps pins SCL\_AVS, SDA\_AVS and SLEEP to be CLK\_REQ1, CLK\_REQ2 and PWR\_REQ pins. The functionality is actually similar to the ENx pins.

Register EN1\_SET1 and EN1\_SET2 define what resource is controlled by PWR\_REQ, EN2\_SETx define the resource controlled by CLK\_REQ1 and EN3\_SETx defines the resources for CLK\_REQ2.

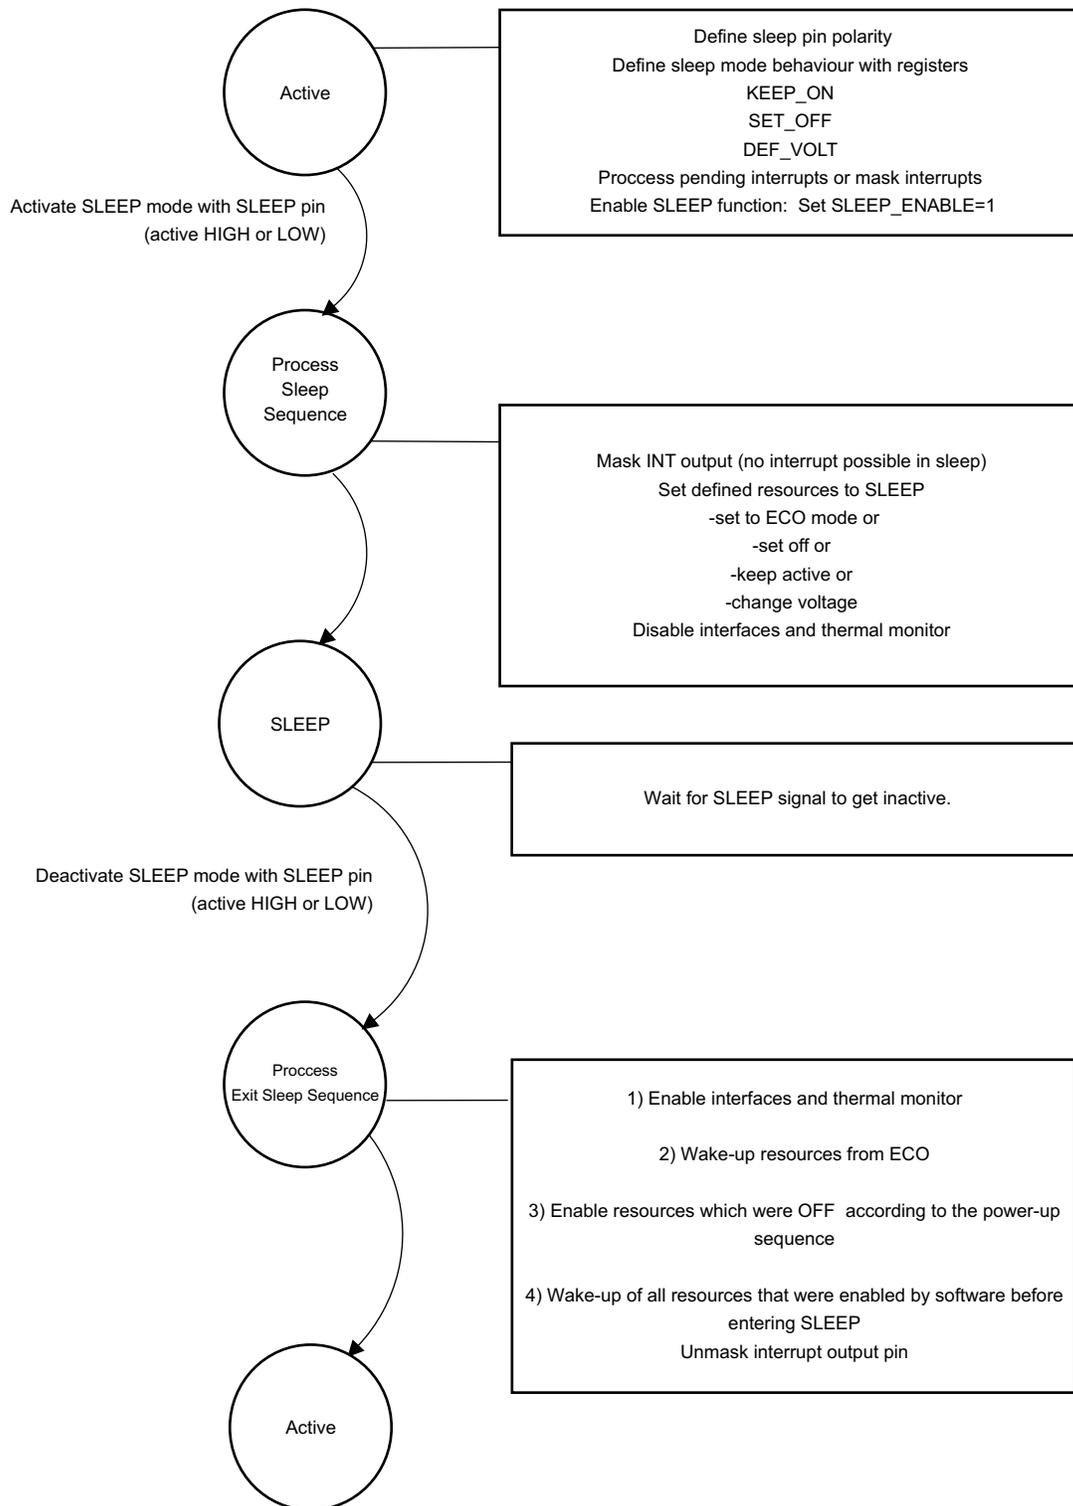

Figure 7-6. SLEEP Flow

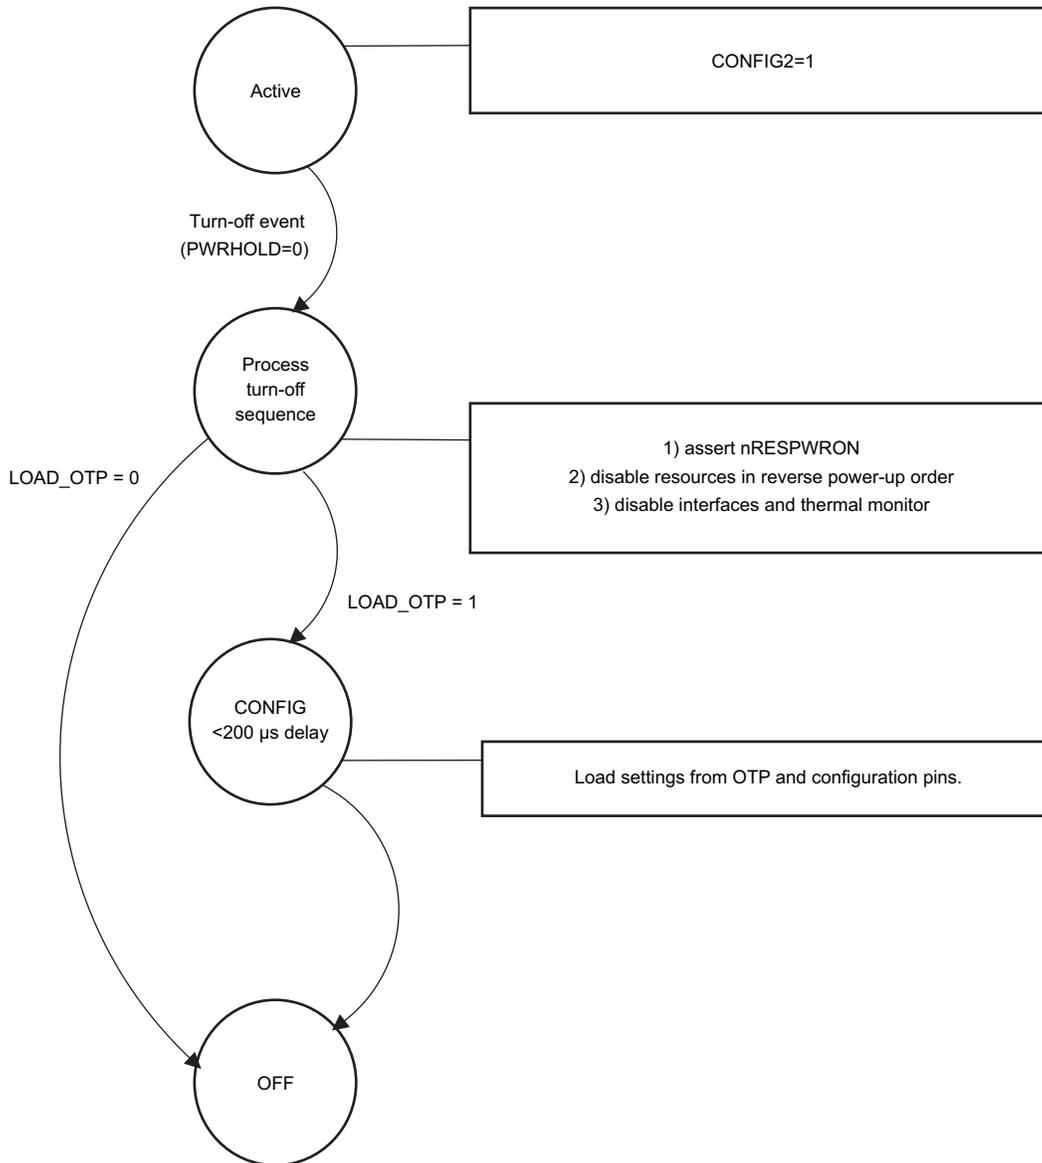

Figure 7-7. SHUTDOWN Flow for CONFIG2=1

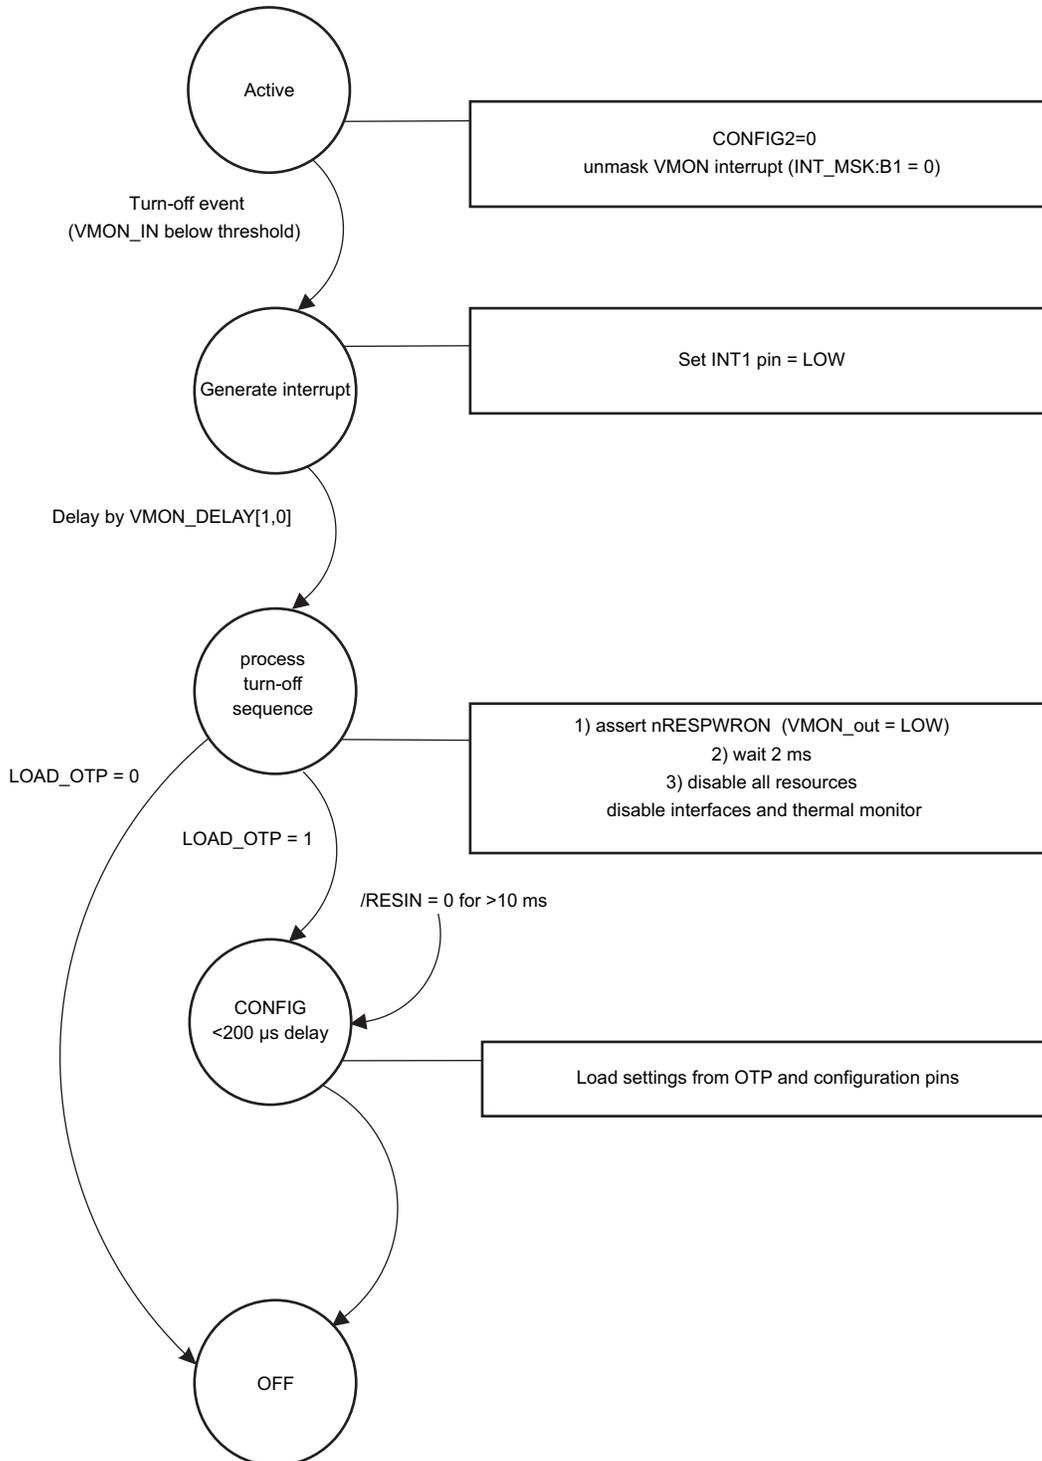

Figure 7-8. SHUTDOWN Flow for CONFIG2=0

## 7.8 Implementation of Internal Power-Up and Power-Down Sequencing

The TPS65912x allows to internally enable resources during power up (going to ON state) and power down (going to OFF state) and for entering and exit of SLEEP mode. The internal power sequencing is defined in OTP memory programmed at TI. The sequencing allows to enable resources in 15 time slots during power-up and power-down. A resource can be associated to any of these 15 time slots that will be processed in the opposite direction during power down. There are 4 settings programmable for the delay, effective for all 15 time slots:

- Tslot\_LENGTH[1,0] = 00: 30  $\mu$ s
- Tslot\_LENGTH[1,0] = 01: 200  $\mu$ s
- Tslot\_LENGTH[1,0] = 10: 500  $\mu$ s
- Tslot\_LENGTH[1,0] = 11: 2 ms

Resources may include:

- Step-down converters
- LDOs
- 32-kHz clock outputs
- nRESPWRON output

Resources that are not part of the automatic sequencing may be configured such that they are enabled by external pins or by their enable Bit in the register set. Resources that are enabled automatically should not be assigned to an external enable pin. A "break point" can be defined that stops power-up sequencing and continues upon the status of the voltage monitor. This allows to hold power-up until the voltage of the voltage monitors exceeds a certain limit.

As shown in [Figure 7-9](#), resources can be mapped to any of the time slots with none, one or multiple resources for any time slot.

---

### NOTE

[Figure 7-9](#) is an example of the programmability of the sequencing and does not match the settings for TPS659120 or TPS659121 as these are shown in the sequencing diagrams already.

---

For SLEEP entry and SLEEP exit, only three time slots are used with a 120- $\mu$ s delay between time slots.

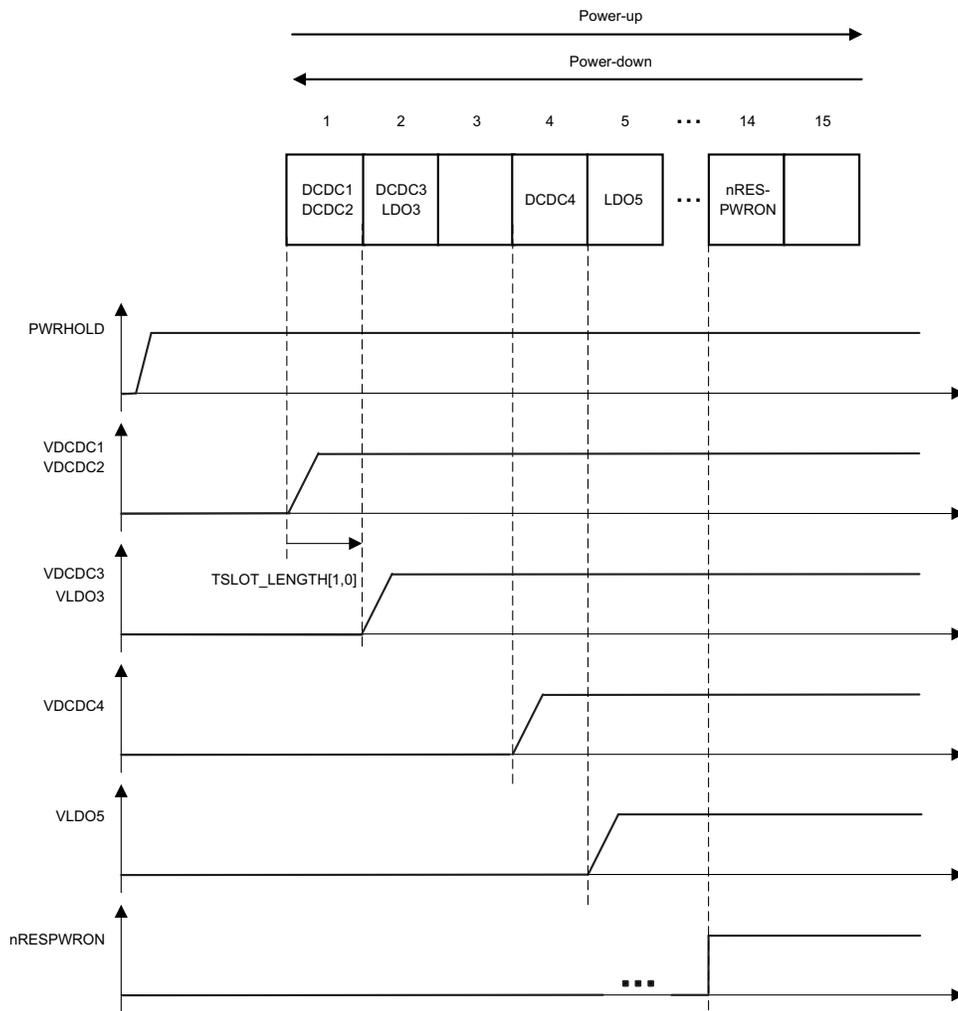

Figure 7-9. Internal Power-Up Example

## 7.9 EN1, EN2, EN3, EN4, Resources Control

ENx control signal can turn ON/OFF Resources based on register setting. It is possible to assigned several resources to one ENx control signal. It is possible to assigned resource to several ENx (active control will be dominant). ENx configuration is done by OTP; however, it is possible to change this setting after power up inside ENx\_SETx registers. ENx is effective only in Active or SLEEP mode. See for further details at [Section 7.11](#) on how the pin status on ENx is interpreted.

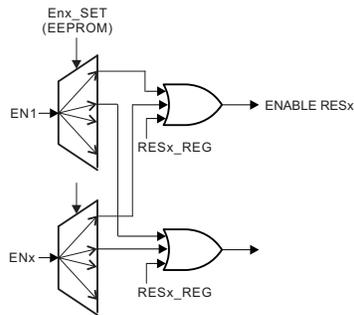

Figure 7-10. ENx Architecture

## 7.10 SLEEP State Control

The sleep control input on pin SLEEP is used to move the IC into Sleep state where resource behavior (DC-DC, LDOs, 32-kHz clock output, and thermal monitor) are defined in registers called SET\_OFF, KEEP\_ON and DEF\_VOLT.

### 7.11 Registers SET\_OFF, KEEP\_ON and DEF\_VOLT Used in SLEEP State; CONFIG2 = 1

Registers SET\_OFF; KEEP\_ON and DEF\_VOLT are used to define the behavior of a resource in SLEEP state. SLEEP state is entered based on the signal at pin SLEEP if enabled by bit DEVCTRL2:SLEEP\_ENABLE. The polarity of an active sleep signal can be changed using bit DEVCTRL2:SLEEP\_POL.

DCDC1 to DCDC4 and LDO1 to LDO4 allow to change the output voltage depending on ACTIVE state vs SLEEP state. See the following for programming of SET\_OFF, KEEP\_ON and DEF\_VOLT:

- Keep resource enabled in SLEEP state: SET\_OFF=x , KEEP\_ON=1
- Turn resource off in SLEEP state: SET\_OFF=1 , KEEP\_ON=0
- Set resource to ECO mode in SLEEP state: SET\_OFF=0, KEEP\_ON=0
- Change the output voltage of a resource when in SLEEP state:
  - DEF\_VOLT=0: voltage defined by \_OP register
  - DEF\_VOLT=1: voltage defined by \_AVS register

### 7.12 Registers SET\_OFF, KEEP\_ON and DEF\_VOLT Used for Resources Assigned to an External Enable Pin; CONFIG2 = 1

As described in [Section 7.8](#), a resource can be assigned to an enable pin. In this case SLEEP state has no effect on such a resource but its behavior is defined by the state of the enable pin. Registers SET\_OFF, KEEP\_ON and DEF\_VOLT are re-mapped and used to define how a resource is acting when the enable pin is set low or is set high. The definition for an high signal on ENx is similar to an ACTIVE state while a low signal on ENx equals the behavior in SLEEP state. See the following for a detailed description:

- Enable resource when ENx pin is set high: SET\_OFF=x , KEEP\_ON=x
- Disable resource when ENx pin is set low: SET\_OFF=1 , KEEP\_ON=0
- Set resource to ECO when ENx pin is set low: SET\_OFF=0, KEEP\_ON=0
- Change the output voltage of a resource when pin ENx is set low:
  - DEF\_VOLT=0: voltage defined by \_OP register
  - DEF\_VOLT=1: voltage defined by \_AVS register

### 7.13 Registers SET\_OFF, KEEP\_ON and DEF\_VOLT for Resources Assigned to Pins PWR\_REQ, CLK\_REQ1 and CLK\_REQ2; CONFIG2 = 0

With the CONFIG2 pin tied to GND, pins ENx are used as voltage select pins DCDCx\_SEL for the DC-DC converters and for LDOs assigned to these pins by register DEF\_VOLT\_MAPPING. These pins are only used to switch the output voltage between two values as defined in registers \_OP and \_AVS.

- DCDCx\_SEL=0: \_OP registers are used to define the output voltage
- DCDCx\_SEL=1: \_AVS registers are used to define the output voltage

The basic function of enabling or disabling resources is re-mapped to pins PWR\_REQ, CLK\_REQ1 and CLK\_REQ2. The pin function is managed by registers ENx\_SETx in the following list. Register EN4\_SETx is not used and should be set 0x00.

- PWR\_REQ: EN1\_SETx
- CLK\_REQ1: EN2\_SETx
- CLK\_REQ2: EN3\_SETx

### 7.14 Voltage Scaling Interface Control Using \_OP and \_AVS Registers with I<sup>2</sup>C or SPI Interface

A dedicated I<sup>2</sup>C\_AVs interface is available for voltage scaling functionality. It works in three different modes.

- I<sup>2</sup>C voltage scaling interface where voltage target can be setup in DCDCx\_OP registers.
- AVSx pin called DCDCx\_SEL can be used as roof or floor configuration where the DC-DC voltage switches between the value defined in the DCDCx\_OP register and the DCDCx\_AVs register.

The slew rate of VDDx voltage supply reaching a new programmed value is programmable though the VDDx\_REG register.

Both I<sup>2</sup>C interfaces are compliant with HS-I<sup>2</sup>C specification (100 kbits/s, 400 kbits/s, or 3.4 Mbits/s)

CONFIG1=0: OTP option A is selected

CONFIG1=1: OTP option B is selected

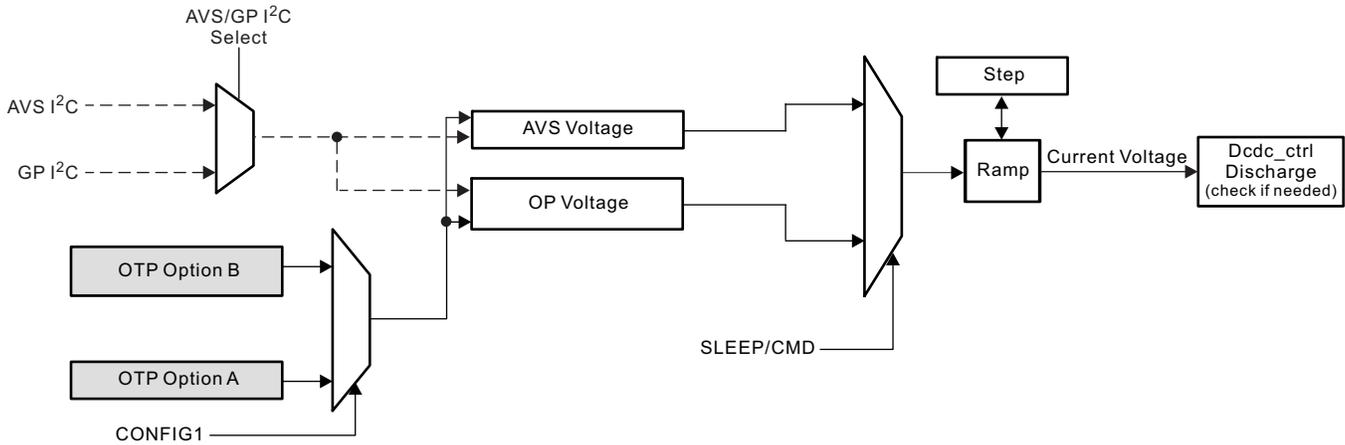

Figure 7-11. DC-DC Voltage Scaling Architecture

### 7.15 Voltage Scaling Using the VCON Decoder on Pins VCON\_PWM and VCON\_CLK

Output voltage control for DCDC1 defaults to internal registers DCDC1\_OP and DCDC1\_AVS or DCDC\_SEL pins for CONFIG2=0. With DCDC1\_CTRL:VCON\_ENABLE = 1, voltage scaling is set to VCON.

When enabled, VCON decodes the VCON\_PWM from VCON\_CLK. It validates the generated output voltage does not exceed 1.1 V when 25-mV step size is selected. For PWM ratios 0/32 to 7/32, the output voltage will clip to 1.1 V. Four ranges can be selected by setting the VCON\_RANGE[1:0] bits in register DCDC1\_CTRL. The range bits towards the converters will be adjusted according to the VCON\_RANGE bits.

The VCON\_CLK and VCON\_PWM signal need to be active and one complete frame received by TPS65912x before it is enabled with DCDC1\_CTRL:VCON\_ENABLE. Once DCDC1\_CTRL:VCON\_ENABLE is set to 0, the voltage setting is reverted back to register DCDC1\_AVS or DCDC1\_OP depending on the DCDC1\_SEL pin. The range bits are fed through as set in the DCDC1\_LIMIT register. For VCON mode, no DVS, MAX voltage comparison nor RANGE information is checked within the VCON DECODER block (but in the digital core as described in the data sheet).

For TPS659121(A) only: VCON is automatically disabled by internally clearing DCDC1\_CTRL:VCON\_ENABLE once the PWR\_REQ pin goes LOW. It not automatically turn on but will have to be enabled in software again after PWR\_REQ was set HIGH.

The function calculates the desired converter voltage based on the in incoming PWM information. The max CLK frequency is 30 MHz. The period of the PWM signal is 1/32 of VCON\_CLK. The decoding follows Equation 1.

$$V_{OUT} \text{ (mV)} = V_{RANGE} \text{ (mV)} - D \text{ (int)} \times (25 \text{ mV or } 12.5 \text{ mV})$$

where

- $V_{OUT}$  is the resulting converter voltage in mV (6-bit bus)
  - $V_{RANGE}$  is the selected voltage RANGE from VCON\_RANGE[1:0] bits
  - D is the time VCON\_PWM is high within 32 clock cycles of VCON\_CLK
- (1)

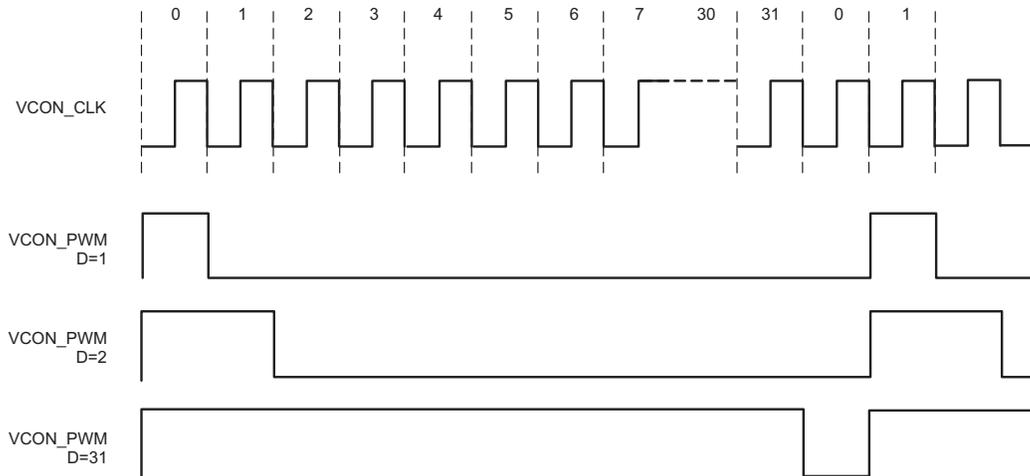

Figure 7-12. VCON Voltage Scaling Architecture

## 7.16 Configuration Pins CONFIG1, CONFIG2 and DEF\_SPI\_I2C-GPIO

The TPS65912x contains two banks of OTP memory that define the default settings programmed. CONFIG1 selects between these two banks of memory. The logic level at pin CONFIG1 in state CONFIG determines which of the OTP banks is used and its content is copied to the user registers to set all OTP configurable options like default voltages and power-up timing.

CONFIG2 is used to remap functions to pins. For CONFIG2=1, pins EN1 to EN4 as well as SCL\_AV5, SDA\_AV5 and SLEEP are active. With CONFIG2=0, these pins are used as DCDCx\_SEL and CLK\_REQ1, CLK\_REQ2 and PWR\_REQ pins.

CONFIG2=1; DEFAULT PIN USAGE	DEFAULT FUNCTION	CONFIG2=0; ALTERNATE PIN USAGE	ALTERNATE FUNCTION
EN1	enable pin for a set of DC-DC converters and LDOs defined by register EN1_SET1 and EN1_SET2 for resources that are mapped to a pin, SET_OFFx, KEEP_ONx and DEF_VOLT define behavior for the case when EN1=0	DCDC1_SEL	DCDC1_SEL=1: output voltage is defined by DCDC1_AV5 register DCDC1_SEL=0: output voltage is defined by DCDC1_OP register
EN2	enable pin for a set of DC-DC converters and LDOs defined by register EN2_SET1 and EN2_SET2 for resources that are mapped to a pin, SET_OFFx, KEEP_ONx and DEF_VOLT define behavior for the case when EN2=0	DCDC2_SEL	DCDC2_SEL=1: output voltage is defined by DCDC2_AV5 register DCDC2_SEL=0: output voltage is defined by DCDC2_OP register
EN3	enable pin for a set of DC-DC converters and LDOs defined by register EN3_SET1 and EN3_SET2 for resources that are mapped to a pin, SET_OFFx, KEEP_ONx and DEF_VOLT define behavior for the case when EN3=0	DCDC3_SEL	DCDC3_SEL=1: output voltage is defined by DCDC3_AV5 register DCDC3_SEL=0: output voltage is defined by DCDC3_OP register
EN4	enable pin for a set of DC-DC converters and LDOs defined by register EN4_SET1 and EN4_SET2 for resources that are mapped to a pin, SET_OFFx, KEEP_ONx and DEF_VOLT define behavior for the case when EN4=0	DCDC4_SEL	DCDC4_SEL=1: output voltage is defined by DCDC4_AV5 register DCDC4_SEL=0: output voltage is defined by DCDC4_OP register
SLEEP	SLEEP pin inactive (polarity is defined with Bit SLEEP_POL): TPS65912x is not in SLEEP state SLEEP pin active: TPS65912x is in SLEEP state; registers SET_OFFx, KEEP_ONx and DEF_VOLT define behavior with SLEEP active	PWR_REQ	enable pin for a set of DC-DC converters and LDOs defined by register EN1_SET1 and EN1_SET2
SCL_AV5	clock input of the voltage scaling (AV5) I <sup>2</sup> C interface	CLK_REQ1	enable pin for a set of DC-DC converters and LDOs defined by register EN2_SET1 and EN2_SET2
SDA_AV5	data input/output of the voltage scaling (AV5) I <sup>2</sup> C interface	CLK_REQ2	enable pin for a set of DC-DC converters and LDOs defined by register EN3_SET1 and EN3_SET2

DEF\_SPI\_I2C-GPIO defines whether the SPI interface or the I<sup>2</sup>C interface is used as the standard communication interface. DEF\_SPI\_I2C-GPIO =0 defines SPI as the standard interface associated to pins SCL\_SCK, SDA\_MOSI, GPIO1\_MISO and GPIO2\_CE. CONFIG1, CONFIG2 and DEF\_SPI\_I2C-GPIO should be tied to GND for a low level and to LDOAO for a logic high level.

Pins CONFIG1, CONFIG2 and DEF\_SPI\_I2C-GPIO should not be switched in operation but hardwired to a logic low level (GND) or a logic high level by connecting them to the LDOAO voltage.

## 7.17 VDDIO Voltage for Push-Pull Output Stages

There is a number of outputs that can either be configured as a push-pull output or are push-pull outputs only. Any pin with a push-pull output stage will generate its output high level by the voltage applied to pin VDDIO. The input voltage range on VDDIO is 1.6 V to 3.3 V with an undervoltage lockout below 1.6 V. With a VDDIO voltage below the undervoltage lockout threshold, the high side driver of the push-pull output stages are disabled and the output default back to open drain. Pins affected are listed below:

- nRESPWRON push-pull or open drain defined by DEVCTRL:Bit3
- INT1 push-pull or open drain defined by DEVCTRL2:Bit6
- VSUP\_OUT same pin with nRESPWRON, definition by DEVCTRL:Bit3
- GPIO1, GPIO2: push-pull only
- GPIO3, GPIO4, GPIO5: push-pull or open drain managed by GPIOx registers
- 32-kHz CLKOUT: alternative function to OMAP\_WDI (input); switched to output by CONFIG2=0, switched to input with CONFIG2=1; push-pull only if output with CONFIG2=0: CPCAP\_WDI is set to 0 with CONFIG2=1: CPCAP\_WDI is the output of the AND gate

## 7.18 Digital Signal Summary

- SLEEP:
  - When all SLEEP condition are met (no pending interrupt, Sleep Ball low, Sleep register set to 1), The IC is transitioning to SLEEP which impact LDO/DC-DC behavior based on settings defined in registers SET\_OFF, KEEP\_ON and DEF\_VOLT. An interrupt or a SLEEP pin level change will cause a transition back to ACTIVE state. This input signal is level sensitive and no debouncing is applied. SLEEP is configurable and is disabled by default, so at power up its status will be ignored. In a user register it can be enabled and its active level changed between active HIGH or active LOW using bits SLEEP\_POL and SLEEP\_ENABLE in register DEVCTRL2.
- PWRHOLD:
  - PWRHOLD pin can be used as ON/OFF signal input (when nPWRON and Interrupt not used). It can also be used as acknowledge (Maintain Power) of power-up sequence trigger by interrupt or press of nPWRON. This input signal is level sensitive and no debouncing is applied. Rising and/or falling edge of PWRHOLD is highlighted through an associated interrupt if interrupt is unmasked.
- NRESPWRON/VSUP\_OUT:
  - NRESPWRON signal is used as the reset to the processor and is in VDDIO domain. It is held low until the ACTIVE state is reached. See [Section 7.19](#), [Section 7.20](#) to get detailed timing.
  - VSUP\_OUT is the output of the voltage monitor that can alternatively be used as a reset to a processor or included in the power-up sequencing such that it hold power up until its output is HIGH or the device power down when LOW.
- 32KCLKOUT:
  - This signal is the output of the 32K RC oscillator, which can be enabled or not during the power-on sequence. It can be enabled and disabled by register bit, during ACTIVE state of the device.
- nPWRON:
  - The nPWRON input is connected to an external button. A debounced falling edge on this signal causes a OFF to ACTIVE state transition of the device. If the device is in ACTIVE/SLEEP mode then a low level on this signal generates an interrupt. If the nPWRON signal is low for more than the PWON\_TO\_OFF\_DELAY delay and the corresponding interrupt is not acknowledged by the external processor in TBDs then the device will go to OFF state.

- INT1:
  - INT1 signal (active low) warns the host processor of any event that occurred on the TPS65912x device. The host processor can then poll the interrupt from the interrupt status register via I<sup>2</sup>C to identify the interrupt source. A low level indicates an active interrupt, highlighted in the INT\_STSx registers. Interrupt flag active will generate a POWER ON enable condition pulse of length TDOINT1 only when the device is in OFF state (when NRESPWRON signal is low). The POWER ON enable condition pulse will occur only if the interrupt status bit is initially low (no previous interrupt pending in the status register). Interrupt status register must be cleared first to allow device POWER OFF during the TDOINT1 pulse duration. Any of the interrupt sources can be masked programming INT\_MSKx registers. The default setting is masking all interrupts. When an interrupt is masked, its corresponding interrupt status bit is still updated, but the INT1 flag is not activated. Interrupt source masking can be used to mask a device switch-on event. The INT output can be programmed as push-pull or open drain output stage with either active LOW or active HIGH output defined by two OTP settings.
- GPIO1, GPIO2, GPIO3, GPIO4, GPIO5:
  - GPIO functionality are muxed with LED and SPI interface. It can be used for event detection or control of external resources during power up.
- VCCS\_VIN\_MON:
  - This is the input for the internal undervoltage lockout monitor. The block provides a selectable low battery warning as well as a undervoltage shutdown.
- VCON\_CLK; VCON\_PWM:
  - Clock and data input for voltage scaling of DCDC1. The feature is enabled by TBD Bit. When enabled, voltage scaling through DCDC1\_OP and DCDC1\_AV5 registers is blocked.
- CLK, MOSI, MISO, CE:
  - Clock chip enable and master in slave out (MISO) and master out slave in MOSI pins for the SPI interface. The pins are shared with the standard I<sup>2</sup>C interface SCL and SDA and GPIO1 and GPIO2
- DEF\_SPI\_I2C-GPIO:
  - Defines whether multifunction pins are used for the SPI interface or for the I<sup>2</sup>C interface and GPIOs. For DEF\_SPI\_I2C-GPIO = 0, the function is assigned to the SPI interface on pins CLK, MOSI, MISO, CE. For DEF\_SPI\_I2C-GPIO = 1, the function is assigned to the I<sup>2</sup>C interface and GPIOs on pins SCL, SDA, GPIO1 and GPIO2.
- SCL\_AV5, SDA\_AV5:
  - Power I<sup>2</sup>C interface, typically used for DVS on the step-down converters. There is a Bit on each step-down converter to switch the voltage scaling registers from the standard I<sup>2</sup>C interface or SPI interface to the power-I<sup>2</sup>C interface. When switched to power-I<sup>2</sup>C, the register is blocked for access through the standard interface.

## 7.19 TPS659121 On/Off Operation With E450, E500

### 7.19.1 TPS659121 Power Up From Battery or 5-V USB Supply; CONFIG1=LOW

PWRHOLD is tied to the supply voltage so TPS65912x starts its power-up sequencing once the input voltage is above the UVLO threshold. After DCDC2, DCDC3 and LDO10 are powered, further power up is pending the status of the voltage monitor based on the VIN\_MON voltage. Once the voltage is above the threshold, VSUP\_OUT goes high and power-up sequencing continues. DCDC1 and LDO1 are controlled by the status of their enable pin PWR\_REQ. CLK\_REQ1 and CLK\_REQ2 are logically OR'd to enable LDO4 and LDO5.

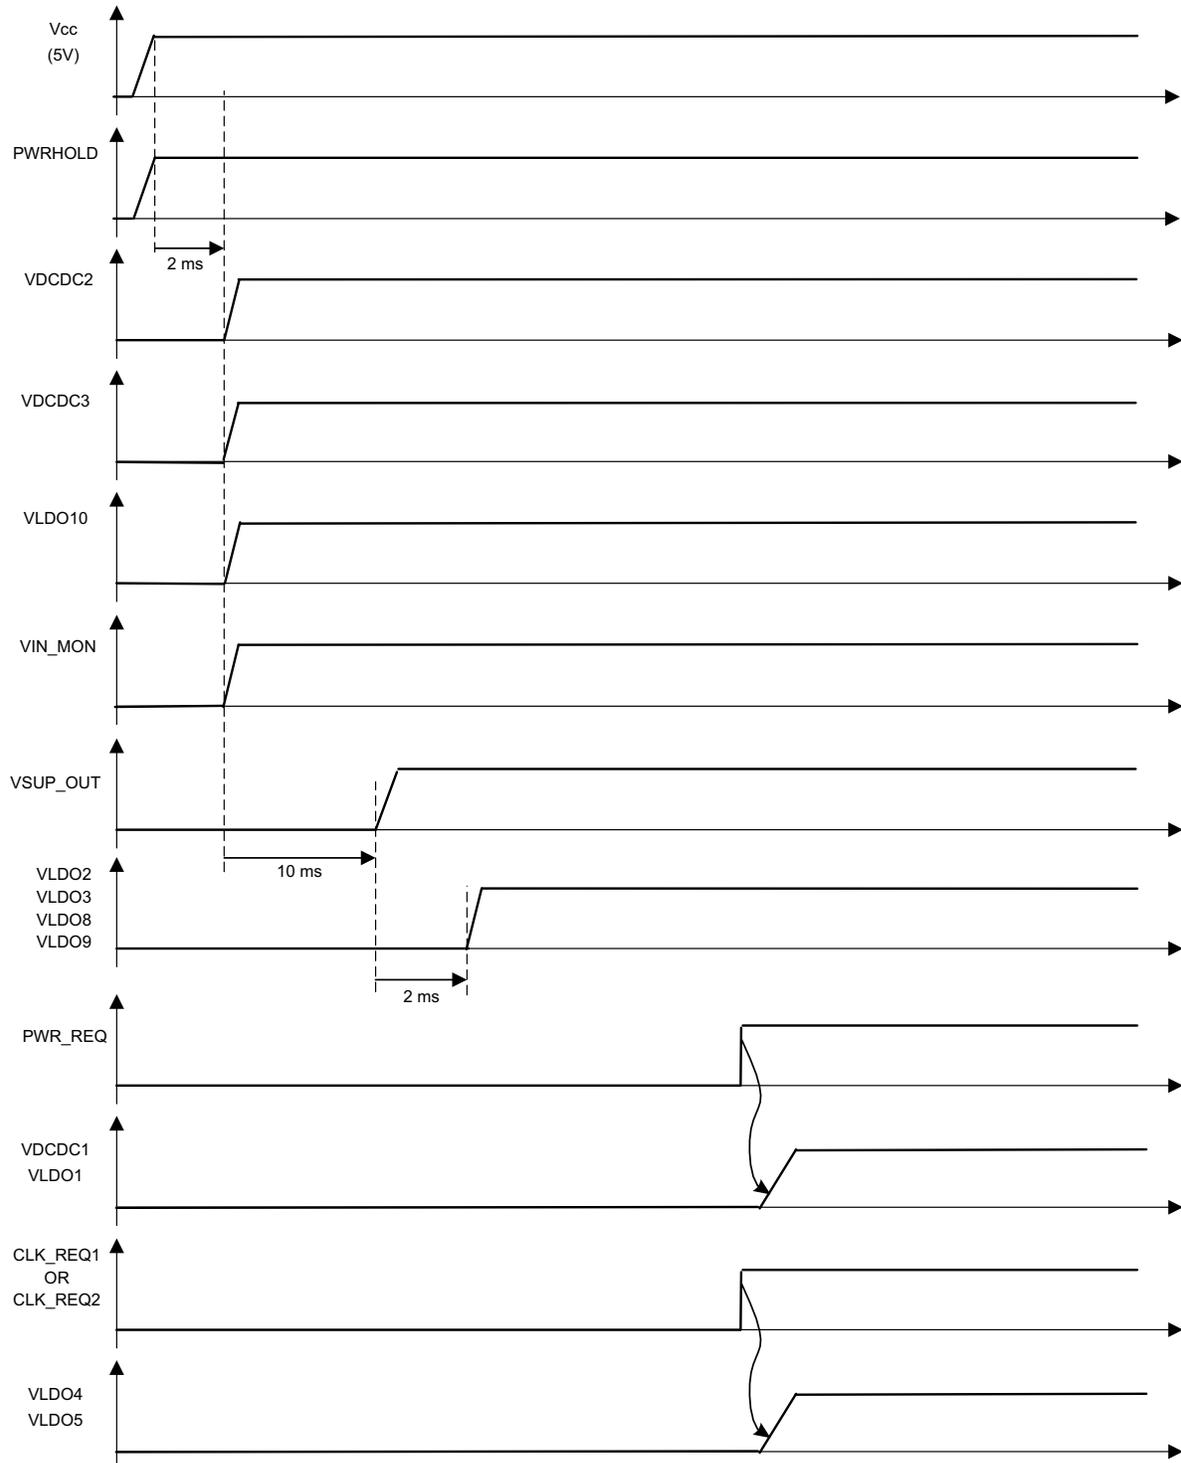

Figure 7-13. TPS659121 Battery or 5 V-USB Power-Up With CONFIG1=LOW

### 7.19.2 TPS659121 Power Up From 3.3-V Host Supply; CONFIG1=LOW

PWRHOLD and VIN\_MON are directly tied to the supply input of 3.3 V. TPS65912x will power up DCDC2 and LDO10 first and wait for VSUP\_OUT going high to continue with LDO2, LDO3, LDO8, and LDO9. PWR\_REQ and CLK\_REQ pins are used to directly control DCDC1 and LDO1 or LDO4 and LDO5, respectively similar to the 5-V USB power up.

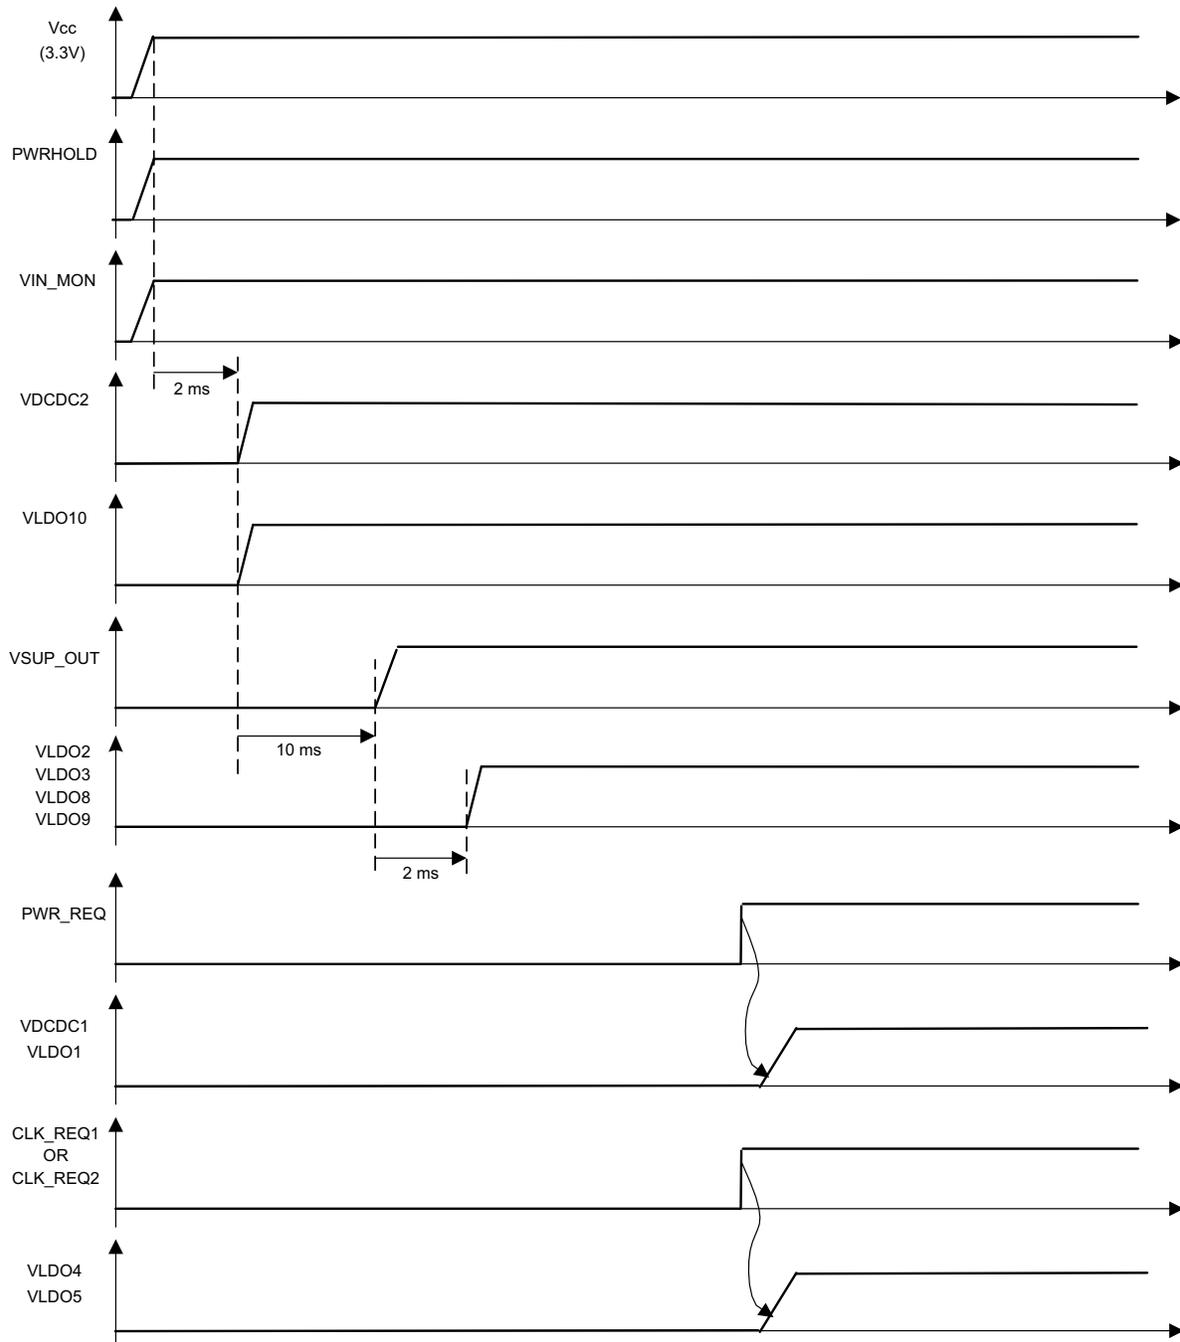

Figure 7-14. TPS659121 3.3-V Host Power Up With CONFIG1=LOW

### 7.20 TPS659122 On/Off Operation for CONFIG1=HIGH

TPS659122 with CONFIG1=HIGH addresses a chip set with a start-up sequencing as defined in the following. See the default voltage table given under , [Figure 7-15](#), [Figure 7-16](#), and [Figure 7-17](#).

### 7.20.1 TPS659122 Power Up With CONFIG1=HIGH

PWRHOLD is tied to the supply voltage, so TPS659122 starts its power-up sequencing once the input voltage is above the UVLO threshold. After the DC-DC converters and LDOs have started, the nRESPWRON signal is released and TPS659122 is ready to respond to commands over its digital interfaces. Pin CLK\_REQ1 is used to enable / disable LDO1 while CLK\_REQ2 controls the enable function for LDO3. DCDC4 is enabled during the automatic power-up sequence along with DCDC2. After nRESPWRON is released high, enable control for DCDC4 is given to pin SLEEP, so pulling the SLEEP pin low will disable DCDC4 after the power-up cycle is completed and nRespwrn has been released.

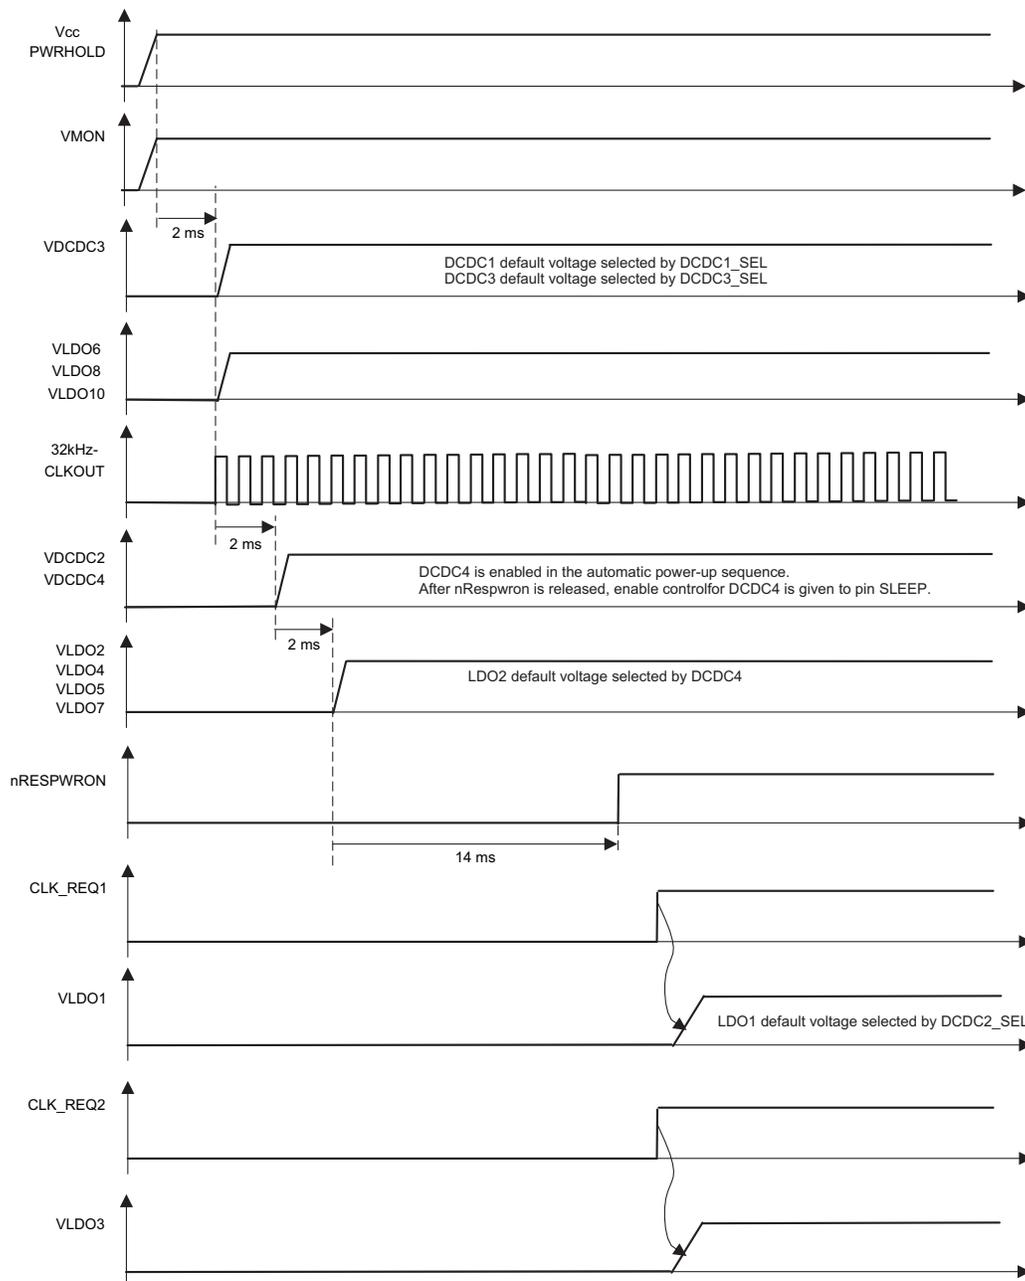

Figure 7-15. TPS659122 Power Up With CONFIG1=HIGH

### 7.20.2 TPS659121, TPS659122 Power-Off Sequence With CONFIG1=HIGH

Once the voltage at the input to the voltage monitor on pin VI\_MON drops below the threshold, an interrupt at pin INT1 is generated by pulling INT1=LOW. After a programmable delay of VMON\_DELAY[1,0] of up to 250  $\mu$ s, VSUP\_OUT goes LOW which triggers the shutdown cycle after another 2-ms delay. During shutdown, all converters and LDOs are disabled at the same time.

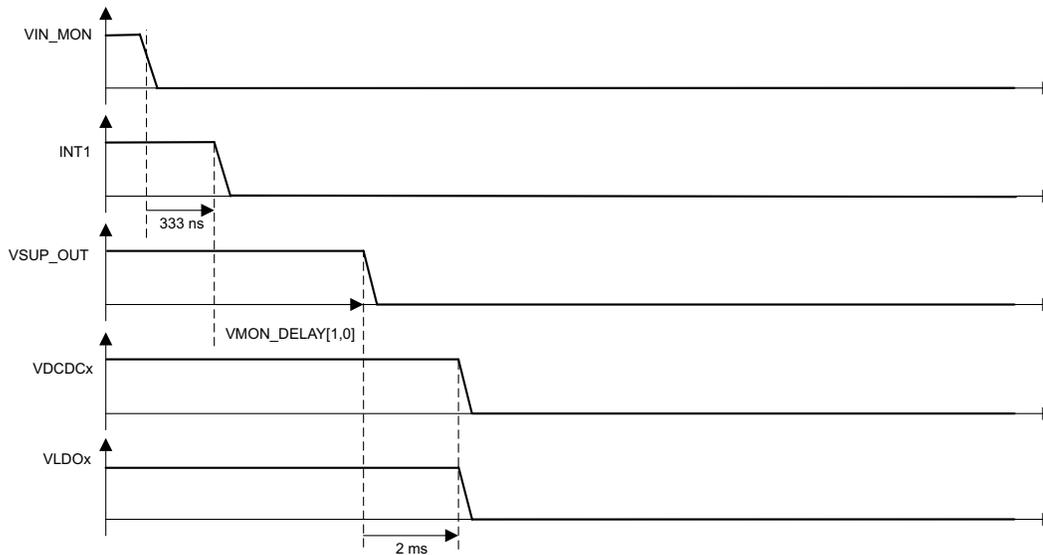

Figure 7-16. TPS659121, TPS659122 Power Cut With CONFIG1=HIGH

## 7.21 TPS659122 On/Off Operation for CONFIG1=LOW

TPS659122 with CONFIG1=LOW addresses a different chipset and, therefore, has default voltage settings and start-up sequencing defined differently compared to CONFIG1=HIGH. See the default voltage table given under and [Figure 7-17](#).

### 7.21.1 TPS659122 Power Up With CONFIG1=LOW

PWRHOLD is tied to the supply voltage, so TPS659122 starts its power-up sequencing once the input voltage is above the UVLO threshold. After the DC-DC converters and LDOs have started, the nRESPWRON signal is released and TPS659122 is ready to respond to commands over its digital interfaces.

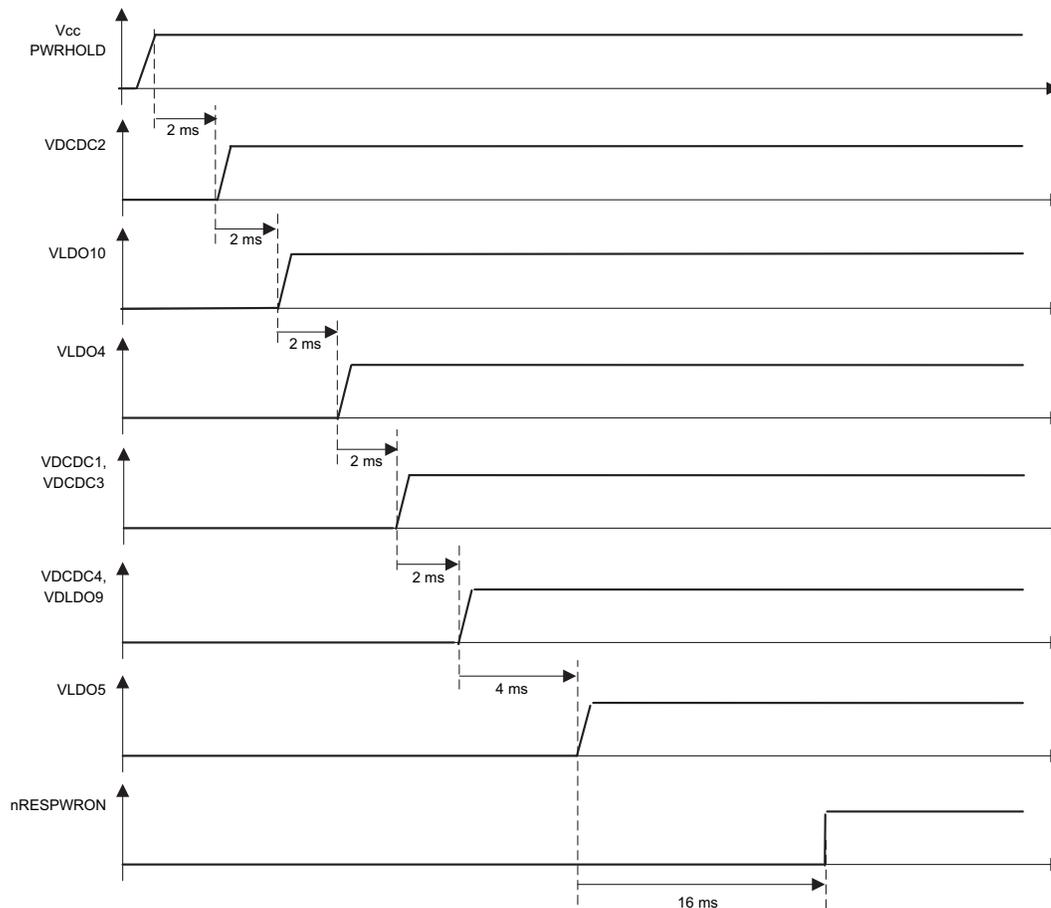

Figure 7-17. TPS659122 Power Up With CONFIG1=LOW

### 7.21.2 TPS659122 Power-Off Sequence With CONFIG1=LOW

When PWRHOLD goes LOW, all resources will power down at the same time.

## 7.22 Interfaces

There are three interfaces in the TPS65912x device. A high-speed I<sup>2</sup>C interface that has access to all register, a SPI interface that can optionally be used to access all registers and a high-speed power I<sup>2</sup>C interface that can be used to dynamically change the output voltage of the DC-DC converters. The power I<sup>2</sup>C interface only has access to the voltage scaling registers of the DC-DC converters. If it is activated by a selection bit, the registers it is using are blocked for the general-purpose I<sup>2</sup>C or SPI interface. All interfaces are active in ACTIVE state only; in all other states, the interfaces are held in a reset and cannot be used to access TPS65912x.

### 7.23 Serial Peripheral Interface

The serial peripheral interface (SPI ) uses 4 signals: A chip enable SPI\_CE, the clock from the bus master SPI\_CLK, an input port SPI\_MOSI (Master In Slave Out), and an output port SPI\_MISO (Master Out Slave In). The read/write Bit is followed by a 8-bit register address followed by 7 bits of unused bits followed by the data bits. The MISO output is set to high impedance when TPS65912x is not addressed by setting CE = LOW; thus allowing multiple slaves on the SPI bus.

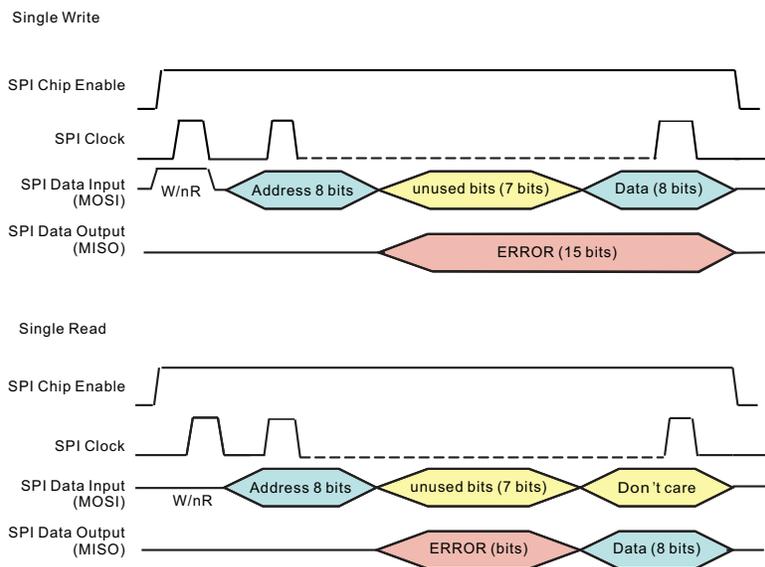

Figure 7-18. SPI READ and WRITE Protocol

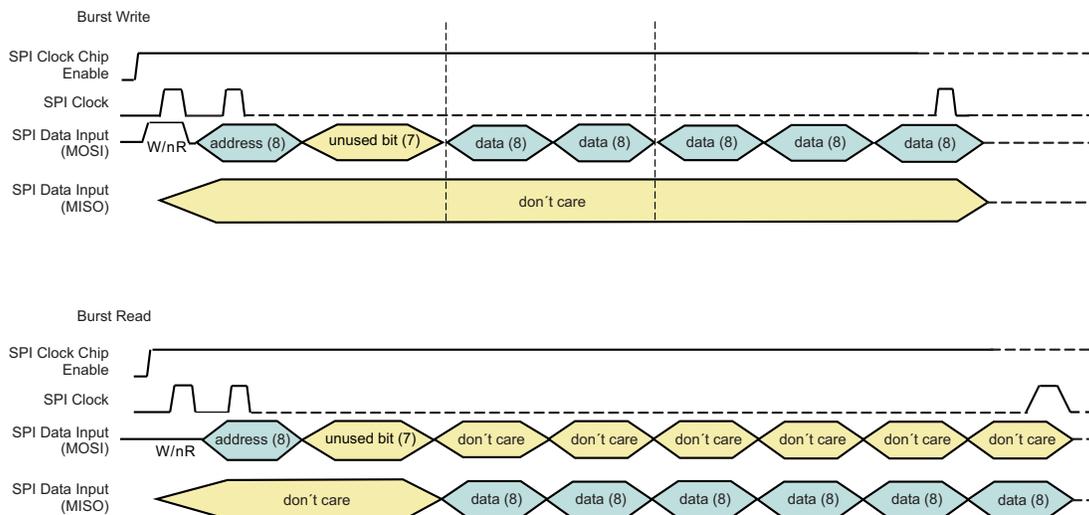

Figure 7-19. SPI BURST READ and BURST WRITE Protocol

## 7.24 I<sup>2</sup>C Interface

I<sup>2</sup>C is a 2-wire serial interface developed by NXP® (formerly Philips Semiconductor) (see [I<sup>2</sup>C-Bus Specification and user manual](#)). The bus consists of a data line (SDA) and a clock line (SCL) with pullup structures. When the bus is idle, both SDA and SCL lines are pulled high. All the I<sup>2</sup>C compatible devices connect to the I<sup>2</sup>C bus through open-drain I/O pins, SDA and SCL. A master device, usually a microcontroller or a digital signal processor, controls the bus. The master is responsible for generating the SCL signal and device addresses. The master also generates specific conditions that indicate the START and STOP of data transfer. A slave device receives and/or transmits data on the bus under control of the master device.

The TPS65912x works as a slave and supports the following data transfer modes, as defined in the I<sup>2</sup>C-Bus Specification: standard mode (100 kbps), fast mode (400 kbps), and high-speed mode (up to 3.4 Mbps in write mode). The interface adds flexibility to the power supply solution, enabling most functions to be programmed to new values depending on the instantaneous application requirements. Register contents are loaded when voltage is applied to TPS65912x higher than the undervoltage lockout level (UVLO) of 2.4 V. Once the device is in ACTIVE state and is turned off, Bit LOAD-OTP [DEVCONTROL:Bit6] forces a reload of the registers when LOAD-OTP = 1 (default). With LOAD-OTP = 0, register content is not changed unless the supply voltage drops below the UVLO threshold. The I<sup>2</sup>C interface is running from an internal oscillator that is automatically enabled when there is an access to the interface.

The data transfer protocol for standard and fast modes is exactly the same, therefore, they are referred to as F/S-mode in this document. The protocol for high-speed mode is different from the F/S mode, and it is referred to as HS mode. The TPS65912x supports 7-bit addressing; 10-bit addressing and general call address are not supported.

### 7.24.1 I<sup>2</sup>C Implementation

There are two I<sup>2</sup>C interfaces on TPS65912x. One for general purpose use referred to as general purpose or standard I<sup>2</sup>C interface and one that is exclusively used for voltage scaling on the DC-DC converters referred to as AVS- or power-I<sup>2</sup>C interface.

The TPS65912x has a 7-bit address with the LSB factory programmable.

The device address for the STANDARD-I<sup>2</sup>C interface is set to *0101101*.

The device address for the AVS-I<sup>2</sup>C interface is set to *0010011*.

Other default addresses are available upon request. Contact TI about different settings.

### 7.24.2 F/S-Mode Protocol

The master initiates data transfer by generating a start condition. The start condition is when a high-to-low transition occurs on the SDA line while SCL is high, see [Figure 7-20](#). All I<sup>2</sup>C-compatible devices should recognize a start condition.

The master then generates the SCL pulses, and transmits the 7-bit address and the read/write direction bit R/W on the SDA line. During all transmissions, the master ensures that data is valid. A valid data condition requires the SDA line to be stable during the entire high period of the clock pulse, see [Figure 7-21](#). All devices recognize the address sent by the master and compare it to their internal fixed addresses. Only the slave device with a matching address generates an *acknowledge*, see [Figure 7-22](#), by pulling the SDA line low during the entire high period of the ninth SCL cycle. Upon detecting this acknowledge, the master knows that the communication link with a slave has been established.

The master generates further SCL cycles to either transmit data to the slave (R/W bit = 0) or receive data from the slave (R/W bit = 1). In either case, the receiver must acknowledge the data sent by the transmitter. An acknowledge signal can either be generated by the master or by the slave, depending on which one is the receiver. Valid 9-bit data sequences consisting of 8-bit data and 1-bit acknowledge can continue as long as necessary.

To signal the end of the data transfer, the master generates a stop condition by pulling the SDA line from low to high while the SCL line is high, see [Figure 7-20](#). This releases the bus and stops the communication link with the addressed slave. All I<sup>2</sup>C-compatible devices must recognize the stop condition. Upon the receipt of a stop condition, all devices know that the bus is released, and they wait for a start condition followed by a matching address

Attempting to read data from register addresses not listed in this section results in a readout of FFh.

### 7.24.3 H/S-Mode Protocol

When the bus is idle, both SDA and SCL lines are pulled high by the pullup devices.

The master generates a start condition followed by a valid serial byte containing HS master code 00001XXX. This transmission is made in F/S mode at no more than 400 Kbps. No device is allowed to acknowledge the HS master code, but all devices must recognize it and switch their internal setting to support 3.4-Mbps operation.

The master then generates a repeated start condition (a repeated start condition has the same timing as the start condition). After this repeated start condition, the protocol is the same as F/S mode, except that transmission speeds up to 3.4 Mbps are allowed. A stop condition ends the HS mode and switches all the internal settings of the slave devices to support the F/S mode. Instead of using a stop condition, repeated start conditions are used to secure the bus in HS mode.

Attempting to read data from register addresses not listed in this section results in a readout of FFh.

## 7.25 Thermal Monitoring and Shutdown

Two thermal-protection modules monitor the junction temperature of the device versus two thresholds:

- Hot-Die temperature threshold
- Thermal Shutdown temperature thresholds

When the Hot-Die temperature threshold is reached, an interrupt is sent to SW to close the non-critical running tasks.

The output of both thermal protection modules is logically OR'd. When the Thermal Shutdown temperature threshold is reached the TPS65912x device is set under reset and a transition to OFF state is initiated. Then the POWER ON enable conditions of the device will not be taken into consideration until the die temperature has decreased below the Hot-Die threshold. An hysteresis is applied to the Hot-Die and shutdown threshold, when detecting a falling edge of temperature, and both detection are debounced in order to avoid any parasitic detection. The TPS65912x device allows to program four hot-die temperature thresholds in order to increase the flexibility of the system.

By default, the thermal protection is enabled in ACTIVE state, but It can be disabled through programming the THERM\_REG register. The thermal protection is automatically enabled during an OFF to ACTIVE state transition and will be kept enabled in OFF state after a switch-off sequence caused by a thermal shutdown event. Transition to OFF-state sequence caused by a thermal shutdown event will be highlighted in the INT\_STS\_REG status register. Recovery from this OFF state is initiated (switch-on sequence) when the die temperature falls below the Hot-Die temperature threshold.

Hot-Die and thermal shutdown temperature threshold detections state can be monitored or masked by reading or programming the THERM\_REG register. Hot-Die interrupt can be masked by programming the INT\_MSK\_REG register.

## 7.26 Load Switch

The load switch on TPS65912x can be used as the following:

- Bypass switch for DCDC4
- Current limited switch if TPS65912x is used in USB powered applications
- A switch to turn on and off high current loads like SD cards

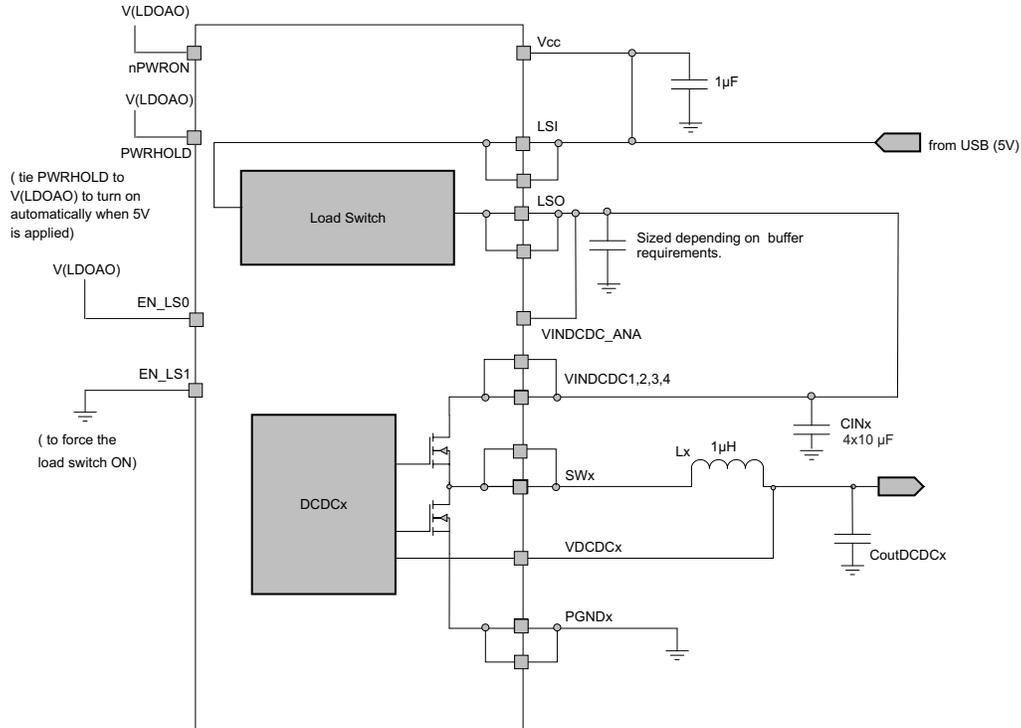

Figure 7-26. Load Switch Connected as USB Input Current Limited Switch

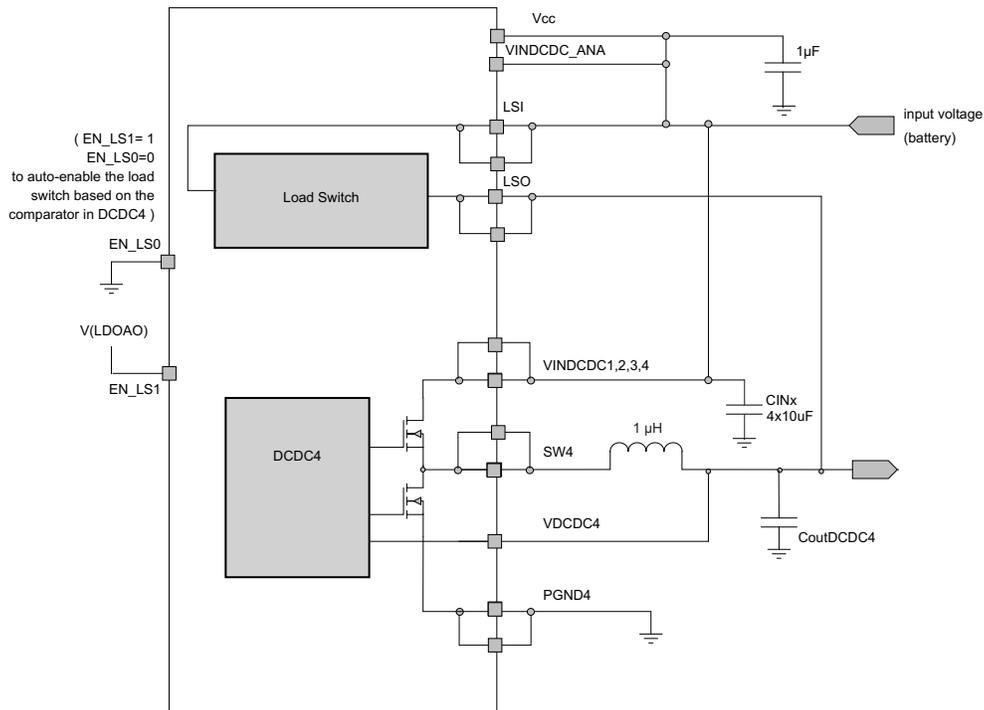

Figure 7-27. Load Switch Connected as BYPASS Switch for DCDC4

There is a register called LOADSWITCH associated to the load switch function allowing it to be used as a bypass switch on DCDC4 or as a current limited switch. There are 4 programmable current limits between 90 mA (typically) and 2.5 A with the default current defined by an OTP setting. The enable bits are mapped to external pins called EN\_LS0 and EN\_LS1. The status of the pins will be copied to the register in state CONFIG, so the usage of the load switch can be externally predefined. In ACTIVE state (or SLEEP), the functionality of the load switch is controlled by the ENABLE0 and ENABLE1 bits only to turn the load switch ON, turn it off or assign it to a comparator as a bypass switch for DCDC4. When the enable function is set to the comparator, it is auto-enabled based on the voltage differential  $V_{in}$  to  $V_{out}$  on the step-down converter, DCDC4.

In case the load switch is used as a bypass switch for DCDC4, there are two additional features. The following features are enabled with LOADSWITCH:ENBALE[1,0] = 10 or 11:

- Forced PWM mode of DCDC4 is blocked if the bypass switch is closed
- The bypass switch is opened automatically when there is an overvoltage condition; LOADSWITCH:ENBALE[1,0] is automatically set "00" in an over-voltage event so the switch is opened

In applications where the load switch is used as an USB input current limited switch or as a load switch on the output of a DC-DC converter to LDO, the above features must be disabled. This is the case when the load switch is enabled with LOADSWITCH:ENBALE[1,0] = 01.

See the LOADSWITCH register in [Section 7.28.2](#) for further details.

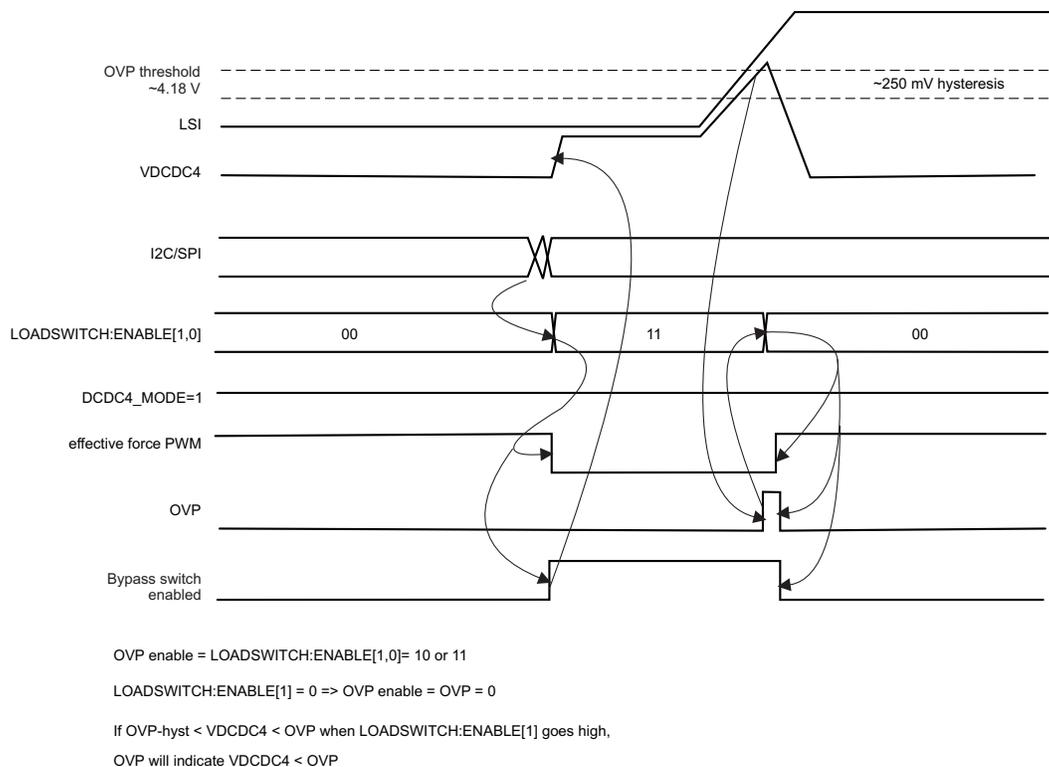

Figure 7-28. Load Switch Timing for LOADSWITCH:ENABLE[1,0] = 10 or 11

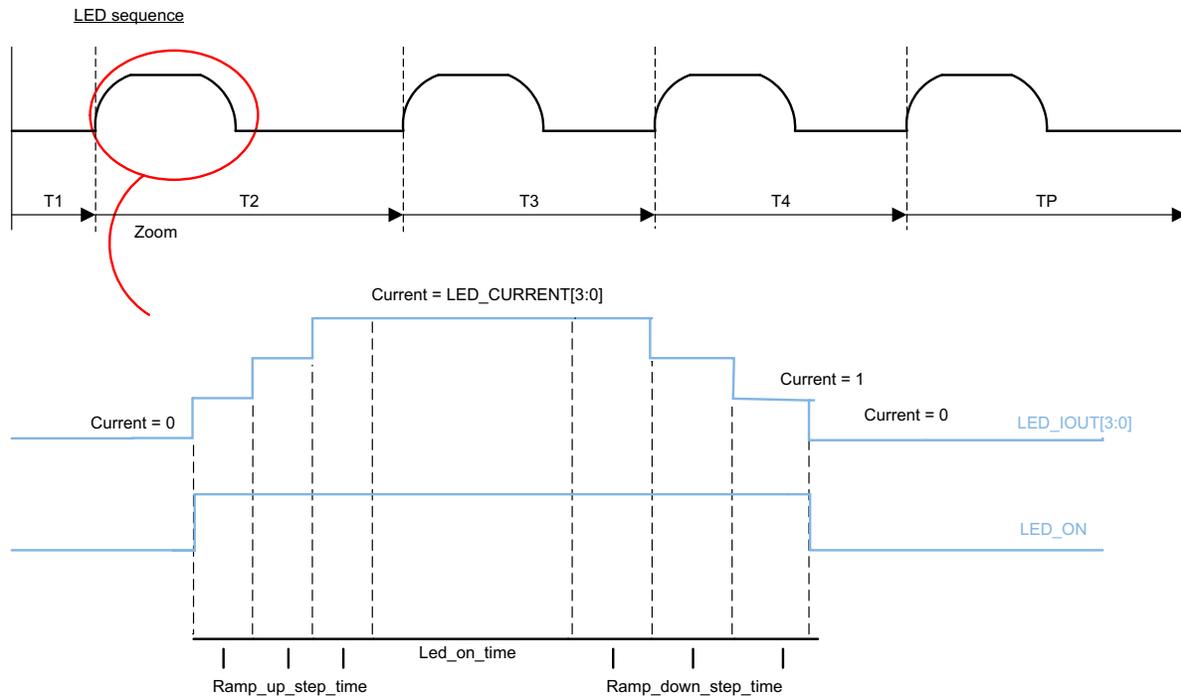

## 7.27 LED Driver

GPIO3, GPIO4, and GPIO5 can alternatively be configured to drive LEDs by setting Bit GPIO\_SEL = 1 in register GPIOx. This will switch the output stage to a current sink controlled by the LED control registers LEDx\_CTRLx, LED\_RAMP\_UP\_TIME, LED\_RAMP\_DOWN\_TIME and LED\_SEQ\_EN. LEDs are enabled in the LED\_SEQ\_EN register. The LED current sink is PWMd with the duty cycle defined LEDx\_CTRL7:LEDx\_PWM[4,0]. All 3 GPIOs should either be assigned as a LED driver or as a standard GPIO.

To turn on LEDA with a constant current of 10 mA:

- Set the GPIO as a LED current sink output: GPIOA:GPIO\_SEL = 1
- Set the constant current to 10 mA: LEDA\_CTRL1:LEDA\_CURRENT[3,0] = 0b0100
- Set the PWM duty cycle to 100%: LEDA\_CTRL7:LEDA\_PWM[4,0] = 0b11111
- Enable the LEDA current sink: LED\_SEQ\_EN:LEDA\_EN = 1

In addition to just turn on and turn off an LED, the LED driver allows to set LED sequence to perform a flash sequence in hardware by enabling the flash sequencer by Bit LEDx\_SEQ\_EN for each of the three LEDs.

T1, T2, T3, T4 : 0, 1 ...127 x 64 ms => reg ledx\_t1, ledx\_t2 ....

Tp : 0, 1 ...127 x 64 ms=> reg ledx\_tp

Ramp step time : 0, 1 ... 31 x 8 ms=> reg led\_ramp\_up\_time, led\_ramp\_down\_time

**Figure 7-29. LED Sequencer**

The LED driver allows to set a dc current in the range from 2 mA to 20 mA for each LED. In addition to this, there is a LED flash sequence programmable defined by T1, T2, T3, T4, and TP. Within these time slots the LED can be turned on defined by LEDx\_ON\_TIME with a defined ramp-up slope set with register LED\_RAMP\_UP and ramp-down slope. The slopes are set to the same value for all three LEDs but other parameters are programmable independently. Figure 7-29 shows an LED flash cycle. The ramp enable bits define whether the current immediately steps to its defined value (LEDx\_CURRENT[3,0]) or ramps with a certain slope.

- During a sequence if LEDx\_RAMP\_EN=0, current immediately goes to LEDx\_I[3:0]
- During a sequence if LEDx\_RAMP\_EN=1, current steps up and down to LEDx\_I[3:0] with a certain slope

In addition, the LED current is pulse-width modulated with a duty cycle defined in register LEDx\_CTRL7.

For the LED driver to operate properly, the time for RAMP-UP + LED\_ON + RAMP\_DOWN must be smaller than the sequence Tn (with n = 1, 2, 3, 4, P).

## 7.28 Memory

### 7.28.1 Register Format

The TPS65912x family consists of several devices. All of them allow to select between two different default configurations stored in OTP memory. The memory bank used, is selected by either setting pin CONFIG1 to a logic LOW or a logic HIGH level. For the complete family there are four different default configurations possible that are given in the register set. Registers that allow different default settings based on the family member and CONFIG1 setting contain separate lines showing their default. Some registers are not configurable in their default settings. For these registers, only one line is shown. The enable bits of resources that are powered up in the automatic power-up sequence are set during this automatic sequence. The status after power up is therefore different from their reset state defined in OTP.

The format in the registers is as given in [Table 7-1](#). A separate *Bit Field Description* table lists the bit names and bit descriptions for each register address.

**Table 7-1. REGISTER NAME<sup>(1)</sup>; Register Address**

7	6	5	4	3	2	1	0
Bit Name	Bit Name	Bit Name	Bit Name	Bit Name	Bit Name	Bit Name	Bit Name
Default settings for TPS659121 for CONFIG1=LOW							
Default settings for TPS659121 for CONFIG1=HIGH							
Default settings for TPS659122 for CONFIG1=LOW							
Default settings for TPS659122 for CONFIG1=HIGH							
OTP = default state is configurable at TI							
R = read or R/W = read/write capability for each Bit

(1) Register reset on Power On Reset (POR)

**Table 7-16. Bit Field Descriptions**

Field	Description
RANGE[1:0]	Selects the output range. See <a href="#">Table 7-20</a> for further information.
MAX_SEL[5:0]	Defines the maximum value the output voltage in DCDC3_AVIS or DCDC3_OP can be programmed to; values exceeding MAX_SEL will be replaced by the value defined in MAX_SEL. If MAX_SEL is set to any other value than 0x3F or 0x00, the RANGE bits and the MAX_SEL bits are locked; contact TI for setting of the max limit in DCDC3_LIMIT.

(1) Register reset on Power On Reset (POR)

**Table 7-31. Register Description**

Field	Description
RSVD	Unused Bit; should be written to 0
MAX_SEL[5:0]	Defines the maximum value the output voltage can be programmed to for LDO2_OP and LDO2_AVS. Values exceeding this limit are ignored. Supply Voltage - setting shown in <a href="#">Table 7-44</a> . If MAX_SEL is set to any other value than 0x00 or 0x3F, the register is set to read only; contact Ti for a default setting in OTP memory if needed.

## 8 Applications, Implementation, and Layout

---

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

---

### 8.1 Application Information

The TPS65912 device is an integrated power-management integrated circuit (PMIC) that comes in an 81-pin, 0.4-mm pitch, DSBGA package. This device was designed for personal electronic, industrial, and communication applications and is dedicated to designs powered from a 5-V input supply that require multiple power rails. The device provides four step-down converters along with an interface to control ten external LDO regulators. The device can support a variety of different processors and applications. The step-down converters can also support dynamic voltage scaling through a dedicated I2C interface to provide optimum power savings. In addition to the power resources, the device contains an embedded power controller (EPC) to manage the power sequencing requirements of systems. The power sequencing is programmable through OTP. The device also contains five configurable GPIOs, a real-time clock module, and three LED outputs. The following sections provide the typical application use-case with the recommended external components and layout guidelines.

### 8.2 Typical Application

8.2.1 DC-DC Converters

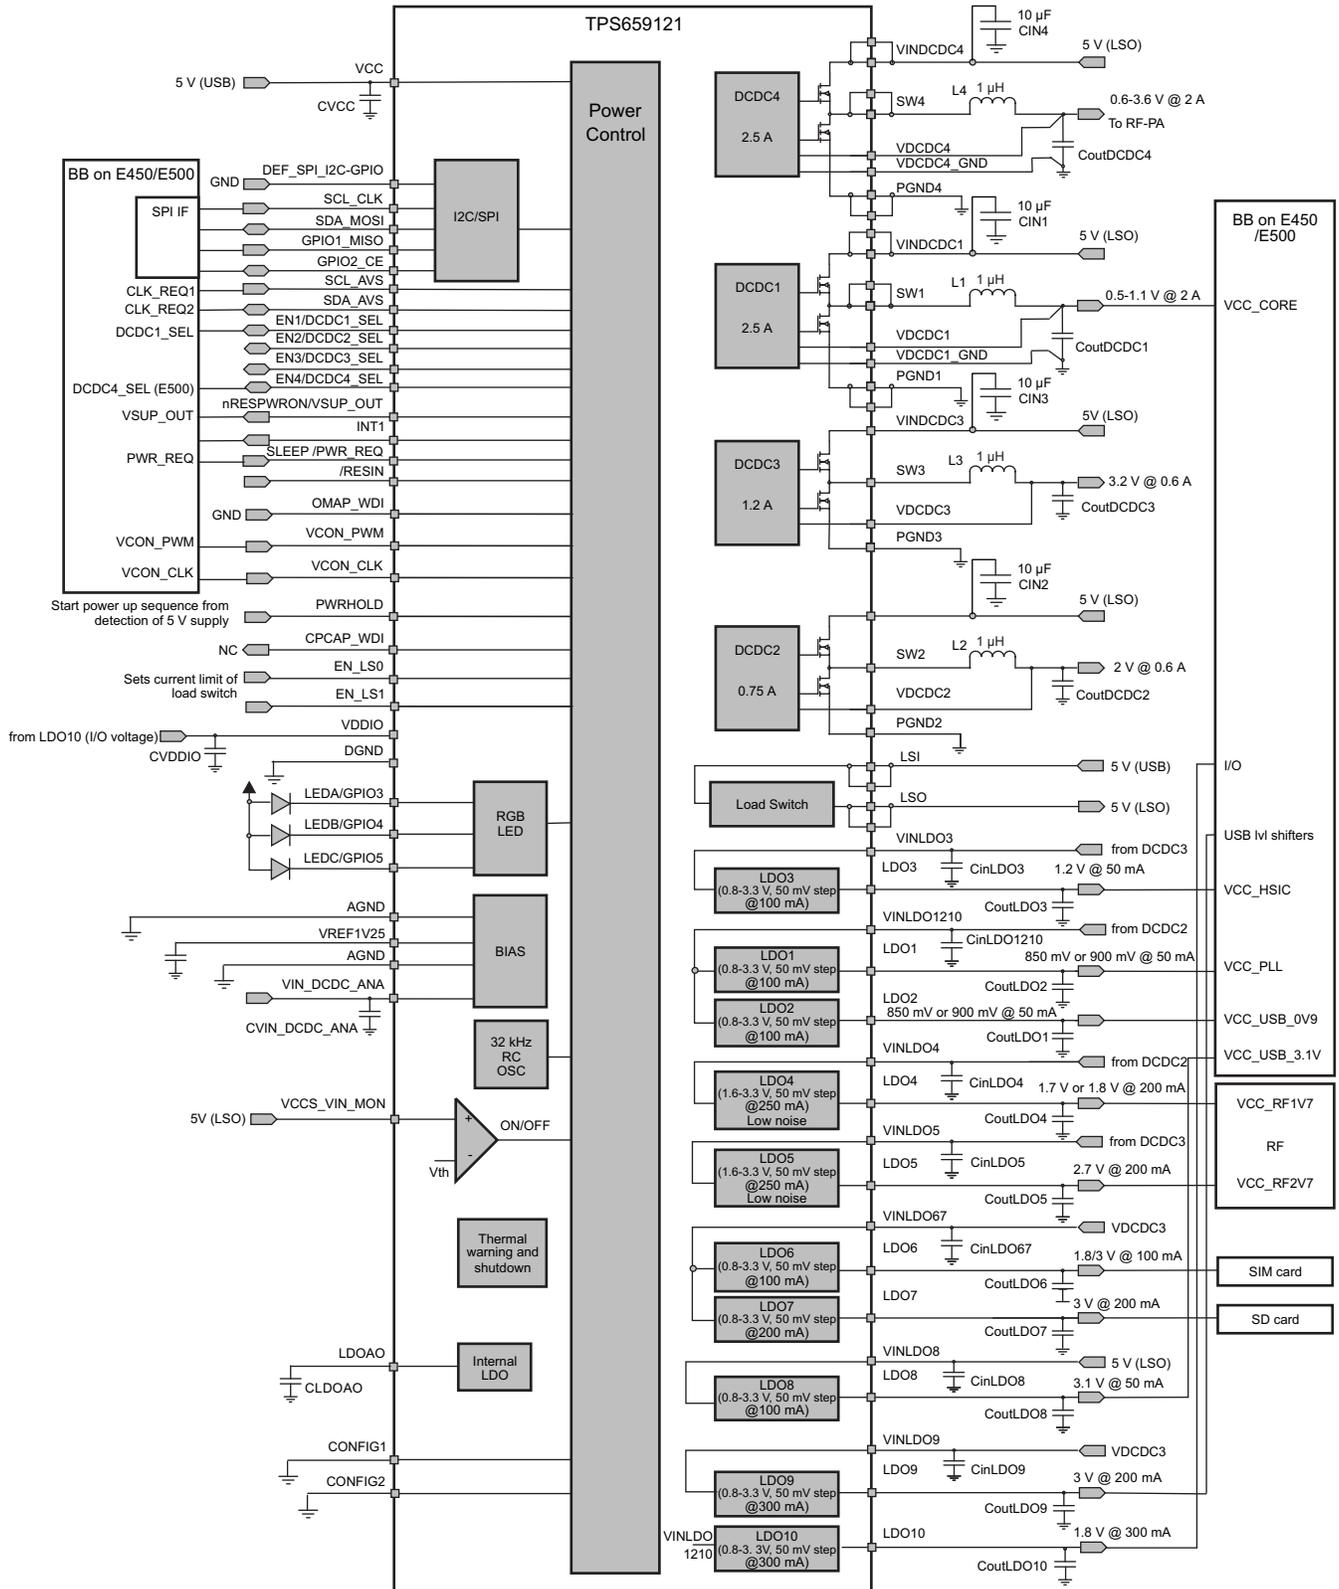

Figure 8-1. 5-V USB Host Connections for E450 and E500 Platforms

### 8.2.1.1 Design Requirements

For a typical application shown in [Figure 8-1](#), [Table 8-1](#) lists the key design parameters of the power resources.

**Table 8-1. Design Parameters**

DESIGN PARAMETER	VALUE
Supply voltage	2.7 V to 5.5 V
Switching frequency	Up to 3.5 MHz
DCDC1 voltage	1.1 V
DCDC1 current	Up to 2.5 A
DCDC2 voltage	2.0 V
DCDC2 current	Up to 0.75 A
DCDC3 voltage	3.2 V
DCDC3 current	Up to 1.6 A
DCDC4 voltage	3.6 V
DCDC4 current	Up to 2.5 A
LDO1 voltage	850 mV or 900 mV
LDO1 current	Up to 100 mA
LDO2 voltage	850 mV or 900 mV
LDO2 current	Up to 100 mA
LDO3 voltage	1.2 V
LDO3 current	Up to 100 mA
LDO4 voltage	1.7 V or 1.8 V
LDO4 current	Up to 250 mA
LDO5 voltage	2.7 V
LDO5 current	Up to 250 mA
LDO6 voltage	1.8 V or 3.0 V
LDO6 current	Up to 100 mA
LDO7 voltage	3.0 V
LDO7 current	Up to 200 mA
LDO8 voltage	3.1 V
LDO8 current	Up to 100 mA
LDO9 voltage	3.0 V
LDO9 current	Up to 300 mA
LDO10 voltage	1.8 V
LDO10 current	Up to 300 mA

### 8.2.1.2 Detailed Design Procedure

[Table 8-2](#) lists the recommended external components.

**Table 8-2. Recommended External Components**

REFERENCE COMPONENTS	COMPONENT <sup>(1)</sup>	MANUFACTURER	PART NUMBER	VALUE	EIA SIZE CODE <sup>(2)</sup>	SIZE (mm)	MASS PRODUCTION <sup>(3)</sup>
<b>INPUT POWER SUPPLIES EXTERNAL COMPONENTS</b>

(1) Component minimum and maximum tolerance values are specified in the electrical parameters section of each IP.

(2) The PACK column describes the external component package type.

(3) This column refers to the criteria.

(4) Component used on the validation boards.

### 8.2.1.2.1 Output Filter Design (Inductor and Output Capacitor)

#### 8.2.1.2.1.1 Inductor Selection

The step-down converters are designed to operate with small external components such as 1- $\mu$ H output inductors. The values given under the recommended operating conditions include tolerances and saturation effects and must not be violated for stable operation. The selected inductor must be rated for its DC resistance and saturation current. The DC resistance of the inductance will influence directly the efficiency of the converter. Therefore an inductor with lowest DC resistance should be selected for highest efficiency.

Equation 2 can be used to calculate the maximum inductor current under static load conditions. The saturation current of the inductor should be rated higher than the maximum inductor current as calculated with Equation 2. This is recommended because during heavy load transient the inductor current will rise above the calculated value.

$$\Delta I_L = V_{out} \times \frac{1 - \frac{V_{out}}{V_{in}}}{L \times f}$$

where

- $\Delta I_L$  = Peak-to-peak inductor ripple current
  - L = Inductor value
  - f = Switching frequency
- (2)

$$I_{Lmax} = I_{outmax} + \frac{\Delta I_L}{2}$$

where

- $I_{Lmax}$  = Maximum inductor current
- (3)

The highest inductor current will occur at maximum  $V_{in}$ .

Open core inductors have a soft saturation characteristic and they can usually handle higher inductor currents versus a comparable shielded inductor.

A more conservative approach is to select the inductor current rating just for the maximum switch current of the corresponding converter. It must be considered, that the core material from inductor to inductor differs and will have an impact on the efficiency especially at high switching frequencies.

Refer to Table 8-3 and the typical applications for possible inductors.

**Table 8-3. Tested Inductors**

INDUCTOR TYPE	NOMINAL INDUCTANCE	SUPPLIER
DFE252012	1 $\mu$ H	Toko
DFE322510	1 $\mu$ H	Toko
DFE322512	1 $\mu$ H	Toko
VLS201612ET-1R0	1 $\mu$ H	TDK
SPM3012T-1R0	1 $\mu$ H	TDK

#### 8.2.1.2.1.2 Output Capacitor Selection

The control scheme of the DC-DC converters allow the use of small ceramic capacitors with a typical value as given in the recommended operating conditions, without having large output voltage under and overshoots during heavy load transients. Ceramic capacitors having low ESR values result in lowest output voltage ripple and are therefore recommended.

If ceramic output capacitors are used, the capacitor RMS ripple current rating will always meet the application requirements. Just for completeness the RMS ripple current is calculated as shown in [Equation 4](#).

$$I_{\text{RMS}C_{\text{out}}} = V_{\text{out}} \times \frac{1 - \frac{V_{\text{out}}}{V_{\text{in}}}}{L \times f} \times \frac{1}{2 \times \sqrt{3}} \quad (4)$$

At nominal load current, the inductive converters operate in PWM mode and the overall output-voltage ripple is the sum of the voltage spike caused by the output capacitor ESR plus the voltage ripple caused by charging and discharging the output capacitor. See [Equation 5](#).

$$\Delta V_{\text{out}} = V_{\text{out}} \times \frac{1 - \frac{V_{\text{out}}}{V_{\text{in}}}}{L \times f} \times \left( \frac{1}{8 \times C_{\text{out}} \times f} + \text{ESR} \right) \quad (5)$$

Where the highest output voltage ripple occurs at the highest input voltage,  $V_{\text{in}}$ .

At light load currents, the converters operate in Power Save Mode and the output voltage ripple is dependent on the value of the output capacitor. The output voltage ripple is set by the internal comparator delay and the external capacitor. The typical output voltage ripple is less than 1% of the nominal output voltage.

#### 8.2.1.2.1.3 Input Capacitor Selection / Input Voltage

Because of the nature of the buck converter having a pulsating input current, a low ESR input capacitor is required for best input voltage filtering and minimizing the interference with other circuits caused by high input-voltage spikes. The converters need a ceramic input capacitor of 10  $\mu\text{F}$ . The input capacitor can be increased without any limit for better input voltage filtering. Ceramic capacitors suffer from the so-called *dc bias effect*. A dc voltage applied at a ceramic capacitor will change the effective capacitance to a value lower than the nominal value. Curves about that behavior are available at the capacitor manufacturers and need to be considered when using the capacitors in applications where a dc voltage is applied and a minimum capacitance must be maintained for proper functionality of the circuit. The values given in the *Recommended operating Conditions* for TPS65912x are for the capacitance. The actual capacitor used may have a larger nominal value that drops with the voltage applied to what is recommended. The capacitance drop depends on the voltage applied, so for a higher voltage; for example, the output voltage of a DC-DC converter or LDO, this must be considered when choosing a proper capacitor.

The input voltage for the step-down converters must be connected to pin VINDCDC1, VINDCDC2, VINDCDC3 and VINDCDC4. These pins need to be tied together with VIN\_DCDC\_ANA to the power source. VCC must be tied to the highest voltage in the system. If the load switch is used as switch on the output, VCC must be tied to the input voltage of VINDCDCx and VIN\_DCDC\_ANA. If the load switch is used as a current limited switch on the input, VCC must be connected to pin LSI while LSO is connected to VINDCDCx and VINDCDC\_ANA. The four step-down converters must not be supplied from different input voltages.

#### 8.2.1.2.1.4 Output Capacitor Table

The DC-DC converters are designed for an output capacitance as listed under the *Recommended Operating Conditions*. A ceramic capacitor, such as X5R or X7R type, is required at the output. [Table 8-4](#) lists capacitors used for TPS65912x.

**Table 8-4. Possible Capacitors**

Value	Size	Vendor	Material and Rating
47 $\mu\text{F}$ / 6.3 V	0805	Murata GRM21BR60J476ME15	Ceramic X5R
22 $\mu\text{F}$ / 6.3 V	0805	Murata GRM21BR60J226M	Ceramic X5R
10 $\mu\text{F}$ / 10 V	0603	Murata GRM188R61A106ME69	Ceramic X5R

Table 8-4. Possible Capacitors (continued)

Value	Size	Vendor	Material and Rating
4.7 $\mu$ F / 6.3 V	0603	Murata GRM188R60J475KE19	Ceramic X5R
4.7 $\mu$ F / 6.3 V	0402	Murata GRM155R60J475ME87	Ceramic X5R

8.2.1.2.1.5 Voltage Change on DCDC1 to DCDC4

The output voltage of the DC-DC converters can be changed during operation by either the digital interfaces or by toggling the DCDCx\_SEL pin or by entering SLEEP state if configured such.

## 8.2.1.4 Layout

### 8.2.1.4.1 Layout Guidelines

As for all switching power supplies, the layout is an important step in the design. Proper function of the device demands careful attention to PCB layout. Care must be taken in board layout to get the specified performance. If the layout is not carefully done, the regulators may show poor line and/or load regulation and stability issues, as well as EMI problems. It is critical to provide a low-impedance ground path. Therefore, use wide and short traces for the main current paths. The input capacitors must be placed as close as possible to the IC pins as well as the inductor and output capacitor.

Keep the common path to the GND pins, which returns the small signal components, and the high current of the output capacitors as short as possible to avoid ground noise. The VDCDCx trace should be connected right to the output capacitor and routed away from noisy components and traces (for example, the L1, L2, L3, and L4 traces).

The most critical connections are:

- PGNDx
- VDCDCx (positive output voltage sense connection)
- VDCDCx\_GND (ground-sense connection)
- AGND
- VINDCDCx, VINDCDC\_ANA, VCC

The PGNDx pins are the ground connections of the power stages, so they will carry high dc- and ac- peak currents. A low impedance connection to the GND-plane is needed, which must be independent from other pins in order not to couple noise into other pins. No other pins must be connected to PGNDx pins.

The VDCDCx pins are the positive-sense connections for the feedback loop. The connection must be made directly to the positive terminal of the pad of the output capacitor. Do not tie the pin to the pad of the output inductor or anywhere in between inductor and capacitor. It is also a good practice to shield the connection by GND traces or a GND-plane.

VDCDCx\_GND is a sense connection for GND and is only available for DCDC1 and DCDC4. The connection can either be made to the GND pad of the output capacitor (preferred) or to the GND-plane directly if there is a solid connection of the GND-plane to the output capacitor. The pin must not be connected to the PGNDx pins as this will couple switching noise into the feedback loop.

The AGND (analog ground) pin is the main GND connection for internal analog circuitry. A proper connection must be made to a GND plane directly by a via. AGND and DGND (located next to each other) may be connected and a via each be used to the GND-plane.

VINDCDCx, VINDCD\_ANA and VCC are supply-voltage-input terminals and need to be properly bypassed by their input capacitors. The CAPACITANCE needed is given in the [Section 5.3](#). As ceramic capacitors will change their capacitance based on the voltage applied, temperature and age, the influence of these parameters need to be considered when choosing the value of a capacitor. The input capacitors are ideally placed on the same layer as the IC, so the connection can be made short and directly on the same layer with multiple vias used from the GND terminal to the GND-plane.

For details about the layout for TPS659121 and TPS659122, see the EVM user's guide, which can be found in the product folder on [ti.com](http://ti.com).

### 8.2.1.4.2 Layout Example

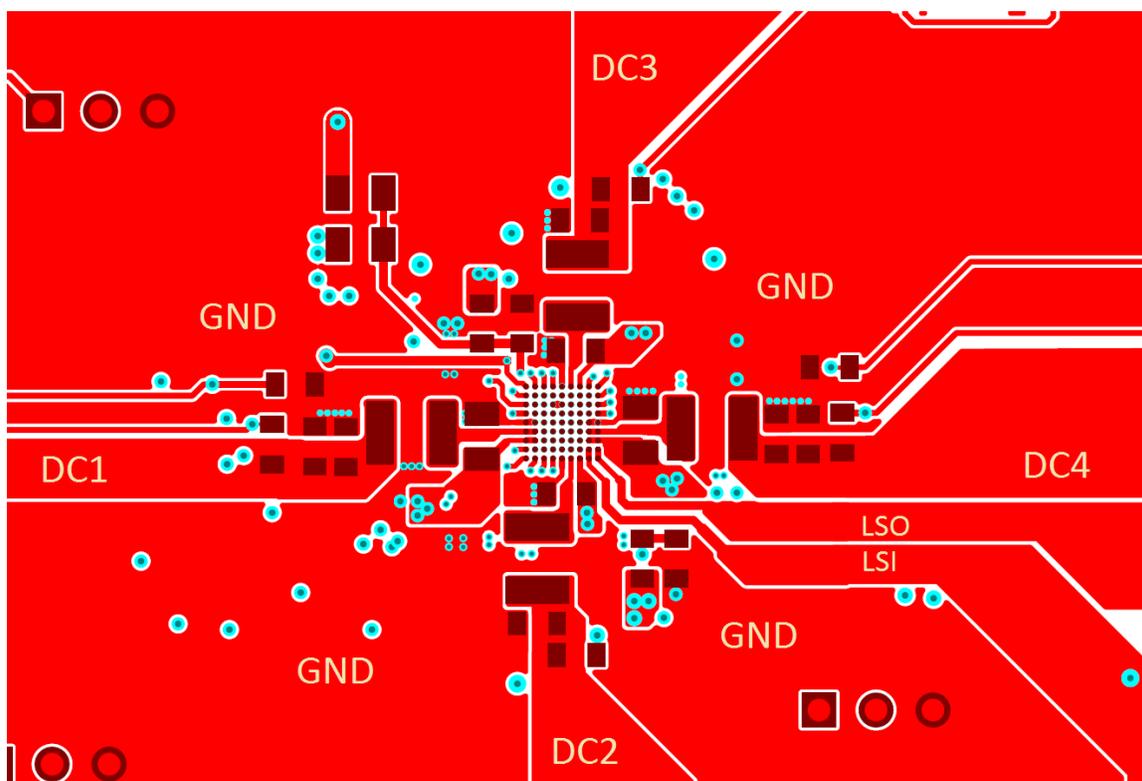

Figure 8-25. Layout Example

## 8.3 Power Supply Recommendations

The TPS65912 device is designed to work with an analog supply voltage range from 2.7 V to 5.5 V. The input supply should be well regulated and connected to the VCC pin, as well as the DCDC and LDO input pins. If the input supply is located more than a few inches from the TPS65912 device, additional capacitance may be required in addition to the recommended input capacitors at the VCC pin and the DCDC and LDO input pins.

## 9 Device and Documentation Support

### 9.1 Device Support

#### 9.1.1 Development Support

TI offers an extensive line of development tools, including tools to evaluate the performance of the processors, generate code, develop algorithm implementations, and fully integrate and debug software and hardware modules. The tool's support documentation is electronically available within the Code Composer Studio™ Integrated Development Environment (IDE).

The following products support development of the TPS659121 and TPS659122 device applications:

**Software Development Tools:** Code Composer Studio™ Integrated Development Environment (IDE): including Editor C/C++/Assembly Code Generation, and Debug plus additional development tools Scalable, Real-Time Foundation Software ( DSP/BIOS™), which provides the basic run-time target software needed to support any TPS659121 and TPS659122 device application.

**Hardware Development Tools:** Extended Development System ( XDS™) Emulator

For a complete listing of development-support tools for the TPS659121 and TPS659122 platform, visit the Texas Instruments website at [www.ti.com](http://www.ti.com). For information on pricing and availability, contact the nearest TI field sales office or authorized distributor.

#### 9.1.2 Device Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all microprocessors (MPUs) and support tools. Each device has one of three prefixes: X, P, or null (no prefix) (for example, TPS659121 and TPS659122).

Device development evolutionary flow:

- X** Experimental device that is not necessarily representative of the final device's electrical specifications and may not use production assembly flow.
- P** Prototype device that is not necessarily the final silicon die and may not necessarily meet final electrical specifications.
- null** Production version of the silicon die that is fully qualified.

X and P devices are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

Production devices have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (X or P) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

For orderable part numbers of TPS659121 and TPS659122 devices in the YFF package types, see the Package Option Addendum of this document, the TI website ([www.ti.com](http://www.ti.com)), or contact your TI sales representative.

### 9.2 Documentation Support

#### 9.2.1 Related Documentation

For related documentation see the following:

Texas Instruments, [TPS65912xEVM-081 User's Guide](#)

### 9.3 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

## 9.4 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

**TI E2E™ Online Community** The TI engineer-to-engineer (E2E) community was created to foster collaboration among engineers. At [e2e.ti.com](http://e2e.ti.com), you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

**Design Support TI's Design Support** Quickly find helpful E2E forums along with design support tools and contact information for technical support.

## 9.5 Trademarks

Eco-mode, Code Composer Studio, DSP/BIOS, XDS, E2E are trademarks of Texas Instruments. NXP is a registered trademark of NXP Semiconductors. All other trademarks are the property of their respective owners.

## 9.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

## 9.7 Glossary

**TI Glossary** This glossary lists and explains terms, acronyms, and definitions.

## 10 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

(1) **Status:** For more details on status, see our [product life cycle](#).

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

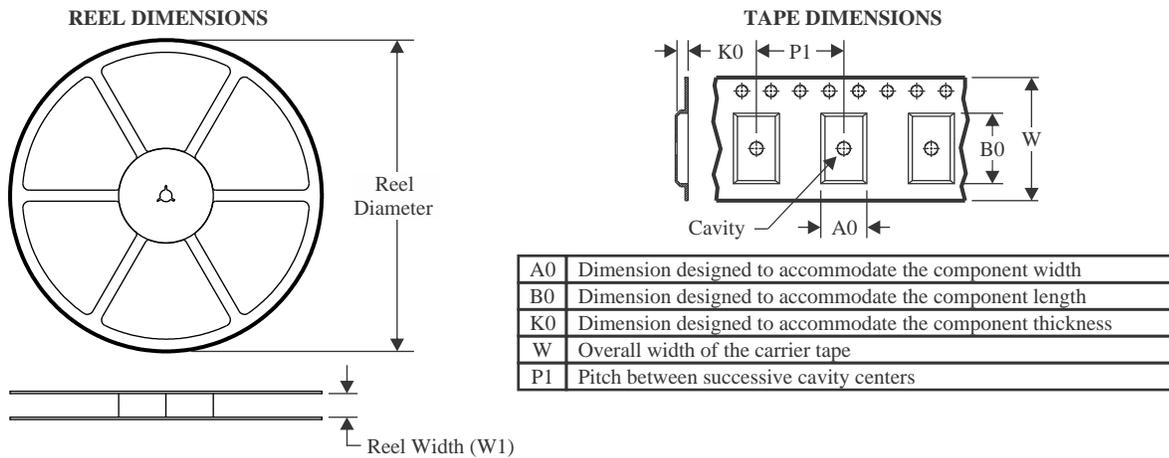

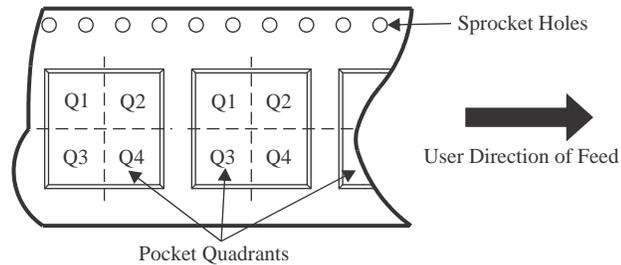

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

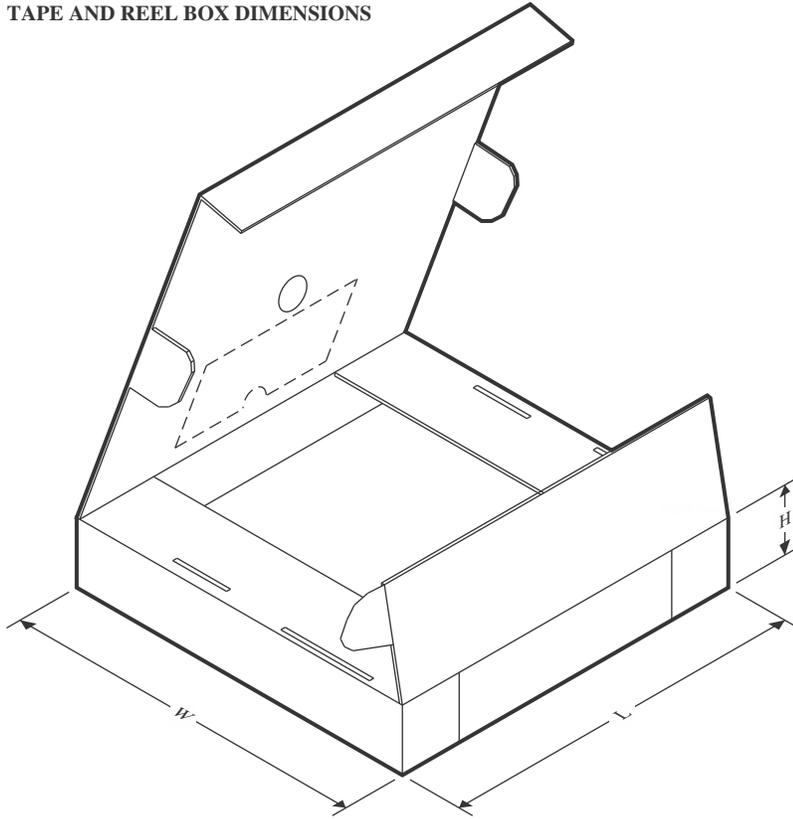

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATASHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES "AS IS" AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for skilled developers designing with TI products. You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, regulatory or other requirements.

These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource. Other reproduction and display of these resources is prohibited. No license is granted to any other TI intellectual property right or to any third party intellectual property right. TI disclaims responsibility for, and you fully indemnify TI and its representatives against any claims, damages, costs, losses, and liabilities arising out of your use of these resources.

TI's products are provided subject to [TI's Terms of Sale](#), [TI's General Quality Guidelines](#), or other applicable terms available either on [ti.com](#) or provided in conjunction with such TI products. TI's provision of these resources does not expand or otherwise alter TI's applicable warranties or warranty disclaimers for TI products. Unless TI explicitly designates a product as custom or customer-specified, TI products are standard, catalog, general purpose devices.

TI objects to and rejects any additional or different terms you may propose.
